Attention was first drawn to this amazing coincidence by Morris Jones, and it is tantalising if true. However, there is some question as to the identity of the three *yn*'s in Welsh, cf. Isaac 'The progressive aspect marker: W. *yn*/OIr. *oc*' (1994), where he proposes that progressive *yn* derives from *wnc* 'close', and Gensler, 'Why should a demonstrative turn into a preposition' (2002), who claims that Welsh predicative *yn* is derived from a deictic *int*.

30 Old Irish infixed pronoun **-d-** *identical to Berber* **-d-**

Pokorny drew attention to this, for instance in 'Keltische Urgeschichte und Sprachwissenschaft' (1959: 157). Its significance is unclear.

31 Comparatives (and superlatives) predicative only, not attributive

This is especially true of Irish, but not of Brythonic or Semitic.

32 Initial focus clefts

Such structures are common across many languages.

33 Yes/no responsives with auxiliary/verb lentire clause

This is considered to be very typical of Insular Celtic (which is held by some to have given rise to English '*yes, it is*', '*no, I don't*', etc.), but is not particularly characteristic of Semitic.

34 Prepositional relative: fronting of bare preposition **the bed in I slept**

Only Irish and Berber have this.

35 Unmarked collective, derived singulative

This is particularly productive in Breton *blew/blewenn* and Arabic *sha'r/sha'ra* 'hair/strand of hair', cf. Hewitt, 'Quelques ressemblances structurales entre le breton et l'arabe' (1985), but less so in Welsh and Hebrew, and it is quite marginal in Irish. It is also found in other languages, such as Swahili *nywele/unywele* (ditto).

36 Virtual complement clause VSO; factual complement clause SVO ~ VSO

'Virtual' complement clauses of the type 'I want John to come' are obligatorily VSO in both Arabic and Breton, whereas 'factual' complement clauses such as 'I think John will come' are obligatorily SVO in Arabic; traditionally they have been VSO in Breton, but since the eighteenth century, an alternative SVO order has become increasingly frequent. It is unlikely that this should be French influence because Breton never has SVO order in the 'I want John to come' type, cf. Hewitt, 'Quelques ressemblances structurales entre le breton et l'arabe' (1985). This similarity is far more likely to be typological rather than substratal in origin.

Arabic	**Breton**
'urīd 'an yajī' Zaid	*me meus c'hwânt e teuffe Yann*
I.want that come.3.SG.SUBJ Zaid	I I.have desire TP come.3.SG.COND Yann
I want Zaid to come	I want Yann to come
'aẓunn 'anna Zaid sa-yajī'	*me a soñj din e teuo Yann*
I.think that Zaid will-come.3.SG	I TP think.3.SG to.me TP will.come Yann
	me a soñj din (penaos) Yann a deuo
	I TP think.3.SG to.me (how) Yann TP will.come
I think that Zaid will come	I think that Yann will come

37 Construct state **bahuvrīhi** *adjectives (Arabic 'improper annexation')*

Many languages have such adjective-noun compounds, including English, cf. '*pure-hearted*', '*great-winged*' below. The construct is formed with a possessive in Celtic, but has the form of a normal construct state in Semitic; note, however, the difference in treatment of the article between Hebrew and Arabic: in Arabic, the dependent noun always has the definite article; when the compound is definite, the whole construct state has, quite exceptionally, a definite article prefixed to it; in Hebrew, it is the article on the dependent noun that determines, in rather more orthodox fashion, whether the compound is definite or not.

un den ledan e chouk (Breton)
a man broad his nape
a well-to-do man (i.e. who can bear a heavy [financial] load)

rajul ṭāhir al-qalb (Arabic)
man pure the-heart
a pure-hearted man

ar-rajul aṭ-ṭāhir al-qalb (Arabic)
the-man the-pure the-heart
the pure-hearted man

nɛšɛr gǎḏōl kǎnāp̄ayim (Hebrew, Ezek. 17:7)
eagle great wings
a great-winged eagle

han-nɛšɛr hag-gāḏōl, gǎḏōl hak-kǎnāp̄ayim (Hebrew, Ezek. 17:3)
the-eagle the-great great the-wings
the large, great-winged eagle

38 Topic ≠ subject ('double subject' sentences)

This is very common in both Breton *Per eo klañv e vab* [Per is ill his son] and Arabic *Zaid marīḍ ibn-uh* [Zaid ill son-his] 'Per/Zaid's son is ill'; Breton *Chirac a dalc'h e fri da voanâd: c'hwessa a ra partoud!* [Chirac TP keeps his nose to narrow.INF: sniff TP he.does everywhere] 'Chirac's nose keeps getting narrower/keeps narrowing: he's sniffing everywhere [for votes]'. Again, this is surely typological; it is found in numerous languages.

39 Yes/no dummy sentential pronoun: **I don't know and he they came**

This concerns a partial resemblance between Breton and Egyptian Arabic, cf. Hewitt, 'Quelques ressemblances structurales . . .'; the main difference is that in Breton the dummy pronoun is invariable, whereas in Egyptian Arabic it must agree in number with the subject: Breton *n-onn ked hag-eñv e oa aed ar baotred* [NEG-I.know not and-**he** TP was gone the boys] 'I don't know whether the boys went'; Egyptian Arabic *sa'al-ni humma r-riggāla rāḥu* [he.asked-me **they** the-men they.went] 'he asked me whether the men had gone'. This is unlikely to be substratal.

Concluding remarks

The existence of striking structural similarities between the Insular Celtic and the Hamito-Semitic languages is beyond question. However, the matter

of whether this is to be attributed to substratal influence through prehistoric contact or to typological tendencies and correlations remains unresolved. Indeed, we have no reliable diagnostic for deciding which of the two factors may be in operation in a given situation. Gensler's statistical approach (the low likelihood of such clustering of 'exotic' features in two genetically unrelated families) is in itself skewed: by focusing on the shared features, he loses sight of the bigger picture, including all the features that are not shared by the two families. Furthermore, he has no way of accounting for the relative frequency or centrality of his various features in the languages concerned.

Authors who are inclined towards a substratal explanation for these shared features appear at times to be prey to a kind of 'substratum frenzy', as if prehistoric contact can be the only possible explanation for 'un-Indo-European' traits in an Indo-European language. This attitude may be rooted in traditional historical linguistics, which has tended to focus on the phonetic and lexical components to the detriment of more abstract structures. With lexical items, for instance, the number of plausible phonetic sequences is so vast that any significant accumulation of lexical similarities between two genetically unrelated languages can hardly be anything other than a sure sign of some sort of contact and borrowing. With structures, however, the range of possibilities across languages is far more limited – there are, for instance, only so many ways of expressing a genitive relation – so it is far less surprising for unrelated languages to possess analogous structures. It is therefore important always to bear in mind and investigate thoroughly the possibility of a typological explanation.

A major problem with the substratal explanation is the precise identity of the substratum. A subsidiary puzzle is the special affinities noted between Welsh and Hebrew (several authors, most recently Jongeling), Welsh and Egyptian (Morris Jones), Irish and Berber (Morris Jones, Pokorny and Wagner), and Breton and Arabic (Hewitt – probably typological: both SVO~VSO topic-prominent languages); in each case, however, the number of features concerned is low enough for the 'special affinity' to be coincidental.

As noted above, Gensler's scores suggest that it is the Insular Celtic languages which are most typical of the 'Celtic/Hamito-Semitic type' rather than the Hamito-Semitic languages. This is also borne out by the above table of shared features by author and language, where the various features are more consistently present in Insular Celtic than in Hamito-Semitic. This is the reverse of what one would expect if the shared features had their origin in Hamito-Semitic. We may take a cue from Jongeling, who, rather than assuming a specifically Hamito-Semitic substratum in Insular Celtic, moots a single prehistoric substratum to both Hamito-Semitic and Insular Celtic. We might go one step further and raise the possibility that such a substratum could have been centred on north-western Europe or even the

British Isles, where it affected the incoming Celtic languages strongly, but the more distant Hamito-Semitic and North African languages less so. The identity of such a substratum, however, would perforce be so shrouded in the mists of prehistory as to be quite unknowable. Clearly, more work is needed on both the substratal and typological approaches to this fascinating question.

Tibetan for 'dog', pronounced /¯k^{h}i/, cf. Welsh *ci*, Breton *ki*, Irish *cú*.

Understanding Bronze Age Scandinavian Rock Art:

The Value of Interdisciplinary Approaches

Introduction

In this article, we employ an interdisciplinary approach to explore the possibility that Scandinavian Bronze Age rock art was created by warrior-trader secret societies as part of the ritual practices associated with long distance exchange activities. Additionally, we suggest that secret societies may have been responsible for the creation and maintenance of a Supra Regional Network that linked the Limfjord/Jutland and Tanum/Bohuslän areas together in Western Scandinavia. (Fig 1). In short, we propose that rock art depictions of warriors represent individuals engaging in activities and rituals conducted by secret societies. Interestingly, these warrior images are often accompanied by depictions of supernatural beings, large ships, the wearing of ritual gear especially with bird-like attributes, bi-horned helmets, masks, and other exotic items characteristic of secret societies (Hayden 2018; Ling et al. 2018, nd).[1] (Fig. 2). In addition to being a boat building location, we posit that the Tanum/Bohuslän area was also an ancient secret society pilgrimage location (c.p. Hayden 2018). These assertions are supported by ethnohistoric and ethnographic observations from various groups in which the relationship between secret societies and the creation of rock art is firmly established. Additionally, we suggest that ethnographic analogies can help to explain some of the rather enigmatic Scandinavian

Figure 1. Map showing the location of the Supra Regional Network encompassing the Limfjord/Jutland area in Denmark as well as the Tanum/Bohuslän region of West Sweden.

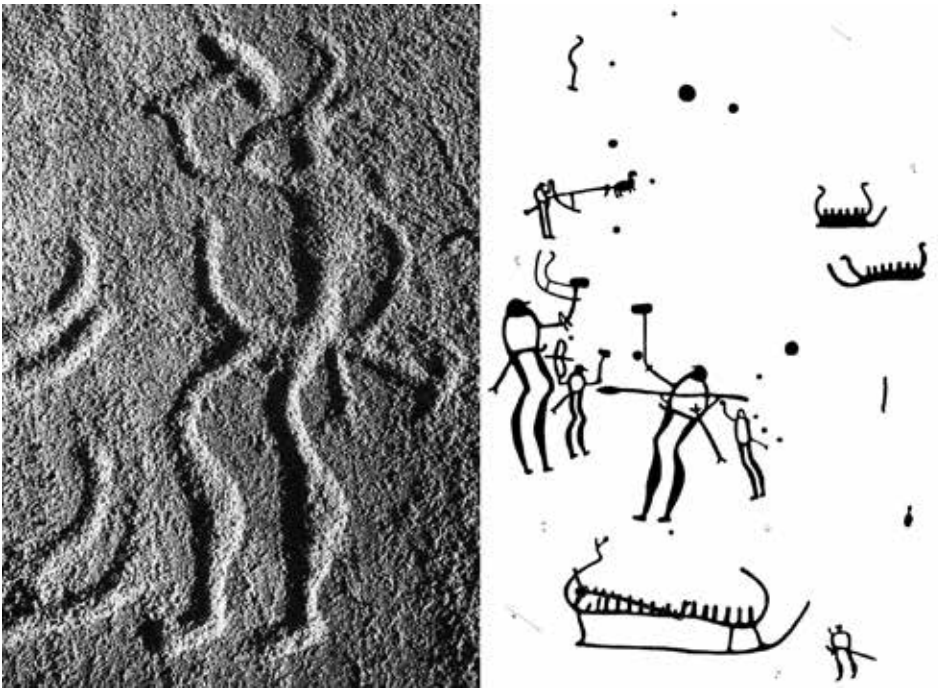

Figure 2. Images of warriors with bird like masks brandishing weapons from Bronze Age Scandinavian rock art locations at Tanum. To the left, the "shaman warrior" from Lövåsen. Photo by B. Almgren. Source: SHFA. To the right, warriors with bird like masks brandishing axes, spears, swords, and bows from Tegneby. Documentation by T. Högberg. Source: SHFA.

Bronze Age feature, often located close to the Bronze Age shore line, commonly referred to as 'cooking pits' (Petersson 2009).

We hypothesize that Bronze Age Scandinavian rock art panels feature individuals from secret society boat-building and seafaring guilds whose members included warriors, traders, mariners, ritual specialists, and boat-building craftsmen who engaged in maritime long distance exchange. Moreover, the processes outlined in this investigation may account for the widespread similarities in Scandinavian Bronze Age art together with its distribution and shed light on how social complexity may have developed in Scandinavia during the Bronze Age.

Our approach incorporates cross-cultural analyses along with theory from the fields of archaeology, cultural anthropology, sociology, and history (Chacon and Hayward 2017; Earle 1997, 2002; Hayden 2018; Ling et al. 2018b). We believe that engaging in such comparisons for the purpose of creating and testing various archaeological models is a valid endeavor (Reybrouck 2000; Melheim et al. 2016). This approach is most appropriate given our focus on social evolution, political economy, social interaction, social inequality and complexity in pre-state societies. We hold that analogies can be useful in the evaluation of various archaeological models (Earle 2013; Ling et al. 2018b). Thus, with this understanding, our theoretical framework is informed by ethnographic analogies, particularly when maritime factors and/or warfare are involved. We also hold that such cross-cultural comparisons reveal specific geographical, socio-cultural, economic, political, technological, and

environmental conditions that have repeatedly shaped humanity's ability to inhabit coastal locations. However, before we proceed any further into these topics, we turn to describing the characteristics of secret societies.

Secret Societies

The term "secret society" is in realty, a misnomer. In fact, a more proper way of describing this type of sodality would be to refer to it as being "a society with a secret"--a secret that conferred power, protection, and wealth on members. Secret societies were relatively common in traditional cultures on five continents and formed an important aspect of ethnographies by many of the leading ethnologists of the last century, including Boas, Drucker, Kroeber, Lowie, Fortune, Wissler, Speiser, Evans-Pritchard, and Talbot (see Hayden 2018). In these societies, it was generally necessary to pay very large amounts to be initiated into these voluntary and very exclusive societies in order to learn the secrets which usually claimed to provide special supernatural knowledge, experiences, protection, and powers. Thus, secret societies are found in societies that are capable of producing substantial surpluses and wealth, as typified by Scandinavian Bronze Age societies and transegalitarian or chiefdom societies in general (Hayden 2018; Ling et al. 2018).

Secret societies could also take the form of warrior organizations which warfare literature sometimes refers to as Gefolgschafts' or "brotherhoods" (Vandkilde 2006; Raffield et al. 2015). An important defining feature of secret societies is also that of forming an exclusive "ingroup." An ingroup refers to "[a]ny group in which an individual is a member; these can be based on chosen or nonchosen characteristics…" (Heinzen and Goodfriend 2019:271). Social psychology research shows that ingroup members tend to discriminate in favor of their own ingroup and they are likely to share a belief in the existence of similarities among fellow ingroup members (Hagtvedt and Johnson 2018). These sociopsychological dynamics operating within ingroups, such as secret societies, greatly enhance the ability to coordinate group effort in an effective manner and thus create significant advantages for such groups in any competitive context, and certainly there was often considerable competition between secret societies for dominance and members.[2] Along these lines, Raffield and co-authors hold that the formation of the Viking fighting units could be understood in light of this ingroup concept (Raffield et al. 2016:37).

Secret societies also operated at regional levels. As documented in many geographical areas from North America to Oceania to Africa, the interaction of secret society members on regional or greater geographic scales is one of their major features. It may be especially important in understanding the regional and supraregional character of rock art in Scandinavia. Secret societies not only provide a motivation for regional interaction and exchange, but also the motivation and ability for creating art together with the means for safeguarding passage to distant communities (see Hayden 2018).

Members of secret societies typically acted to concentrate wealth and power in their own hands and sometimes directly controlled trade in all valuable goods as with the Poro of West Africa (Harley 1968). As such, they also typically dominated or controlled local and regional political organizations. Special task-orientated groups were often part of secret society roles and ranks as well, sometimes involving incipient specialization of labour that included war bands/units, carvers or other artists, mariners, hunters, herders, smiths, or others (Hayden 1995; Birx 2006). Significantly, Bronze Age Scandinavian rock art, is generally associated with most of these activities (Goldhahn and Ling 2013). The location of rock art with ritual themes, is moreover, clearly spatially linked to maritime locations (Ling 2008). Moreover, several scholars maintain that Scandina-

vian Bronze Age rock art depicts staged social (and ritual) dramas that aimed to assert a specific social order (Coles 2005; Ling 2008; Goldhahn and Ling 2013). We would add that establishing a hierarchical social order was precisely what secret societies were trying to do. Along these lines, Hayden states that "Secret society private *and public performances* constituted ritual theatre in which stage magic proliferated. Like good actors everywhere, they played their roles consummately… Shows and claims of power were meant to *impress audiences* and to try to make them believe in the powers claimed by secret society members..." (Hayden 2016:12 [emphasis added]). Many of these public performances may have included power battles between ritualists or "shaman" members in order to demonstrate who was the most supernaturally powerful, as perhaps depicted in some Scandinavian rock art. Shamans engaging in dramatic contests designed to demonstrate their alleged supernatural abilities have been widely documented among native peoples such as the Maidu, Yokuts, Sioux, and Potawatomi (Gayton 1930; Kroeber 1925; Landes 1963). These competitive encounters have been described as instances of "ceremonial jousting" (Landers 1963:559). More specifically, Hill Maidu ritual specialists held shamanic contests in which "[t]hey gather in the [secret society] dance house *from long distances*…[and] Power is exerted by a supernatural shooting or transmission" (Kroeber 1925:424, emphasis added). Another example can be found in the spectacular ritual battles that took place among the Yokuts. These contests "consisted of the magical killing of shamans who were arranged in opposing rows and 'shot' at each other with magic 'air-shot.' Only the doctor [shaman] who projected the fatal shot into a fallen opponent could withdraw it. If the shot were not removed the victim would not regain consciousness, and would die within a few days" (Gayton 1930:401).

Finally, it needs to be recognized that secret societies, while not universally present in traditional societies at the transegalitarian (ranked) or chiefdom level of political organization, were, nevertheless very common cross-cultural occurrences in these ethnographically-documented societies. Therefore, we should expect to find them frequently occurring in prehistoric societies including many of those in Europe at these levels of political integration. We think that many of the characteristics of Scandinavian Bronze Age maritime societies are indicative of secret society organizations.

Secret societies and rock art

The association between secret societies and rock art is widespread, and secret societies in general were one of the principal creators of art in various media, especially masks. For example, in North America, ethnographic evidence links secret societies to both masks--like the renown Northwest Coast masks--and rock art. According to Drucker (1940:221), the carving of petroglyphs by initiates was part of the ritual activity required for admission into certain secret societies of the Tsimshian on the Northwest Coast. Given the nature of secret societies, only Northwest Coast Tsimshian secret society members would have possessed the esoteric knowledge of the underlying meaning/symbology of this rock art.

The following example from the maritime based Northwest Coast Bella Coola of British Columbia not only provides additional ethnographic evidence linking secret societies like the *kusiut* society with the creation of rock art but it may also shed light on its function in these societies. In addition, the landscape documented by McIlwraith helps elucidate reasons for the locations of Bronze Age rock art in the Scandinavian landscape.

> Bella Coola chiefs would always call for a meeting whenever a new member was to be initiated into the kusiut secret society. Near every village is a place where the chiefs hold such

meetings. All the inhabitants know the general locality, but there is such dread of the supernatural powers possessed by members of the kusiut society that none would dare go there. If an uninitiated person should do so, he would formerly have been either killed or initiated into the society. The meeting-place of the Qomqo-ts chiefs is on a ledge or rock jutting out over a waterfall about a quarter of a mile from the village. The stream winds down a narrow cleft of the mountain side, screened by dense vegetation, and suddenly falls into a cauldron, so hemmed in by cliffs that no sunlight can enter. The ledge is immediately above the brink of the falls, one of the most awe-inspiring places imaginable. The meeting-places of other villages lack such natural settings, though all are at the bases of cliffs, or near some easily distinguished feature. Some of them are decorated with *rude carvings, pecked into the stone*. The meaning of the designs is not known to any of the present inhabitants. Some of them were made, long ago, by chiefs when they were composing tunes; they picked out the rock in time to the music forming in their minds. Others were mere memorials of certain events. If a chief gave an important ceremony, he, or one of his friends, carved a figure, perhaps that of a man, perhaps of some animal connected with the rite, to recall the occasion (McIlwraith 1948:177-178, emphasis added).

Importantly, for the Bella Coola, the rock art associated with highly esoteric secret society initiation rituals was located at some distance from village sites. The fact that the rock art was created away from settlements, and that access was probably hidden and prohibited to non-members, has also been stressed in terms of the Scandinavian Bronze Age rock art (Goldhahn and Ling 2013). This is further illustrated by Figure 3.

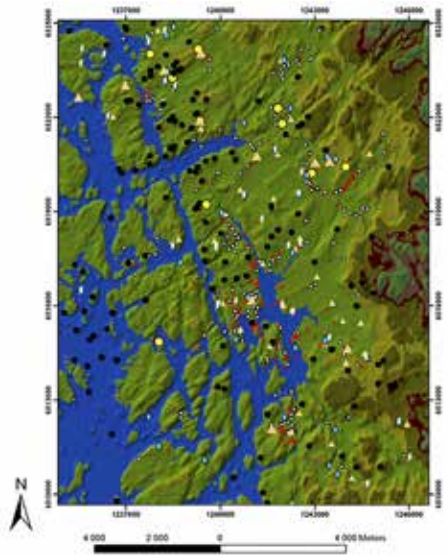

Figure 3. Map showing different Bronze Age sites in the Tanum/Bohuslän region and showing a shoreline about 15 m higher than presently. Red dots = rock art sites; white dots = cup mark locations; black dots = cairns; large buff triangles = settlement finds (carbon dates, ceramics, or other features) dated to the Bronze Age; small buff triangles = indicate settlements from the Bronze Age; yellow dots = bronze items; blue diamonds = flint daggers; white flashes = flint sickles. After Ling (2014).

Other scholars also report links between rock art and secret society initiation rituals as indicated by the following: "The magical fraternities [i.e., secret societies] of the North American Indians hold a most important place in the social and religious life of the people. Candidates for initiation give much attention to the preparation of the songs and chants sung by members at the lodge meetings or at the public performances of the [secret] societies. By means of elaborate rituals and songs, by *pictographs* and sand paintings, the religious traditions concerning the ancestors of the tribe are carefully preserved" (Webster 1908:179, emphasis added).

Links between rock art and secret society ceremonies can also be found in other parts of the world. For example, the rock art found at the Kanamuget site

in Uganda is associated with Sor secret society spirit mediums (Namono 2017). Additionally, the Nyau secret society members of central Malawi and eastern Zambia were known for their tradition of creating rock art (Smith 2001). Moreover, some investigators report the existence of a nexus between rock art and "secret male unions" (i.e. secret societies) in Siberia and the Lower Amur region (Lapshina 2016:1331). "In the Lower Amur basin, there are numerous monuments of rock art. They are characterized by the predominance of skull masks. The semantic content of these artifacts allows [us] to identify them as the main attributes of the rituals of the secret male unions [secret societies]..." (Lapshina 2016:1320). The highly decorated petroglyph panels in Yalo Cave on Malekula Island (Vanuatu) appear to have been created by secret societies (Hayden 2018:230), while Condor Cave in Southern California was decorated with paintings related to the winter solstice and was used by secret society specialists for rituals at the winter solstice (Hudson and Underhay 1978:53, 55, 69-70).

Many factors link the propagandistic and esoteric nature of Bronze Age Scandinavian rock art to Hayden's (2016) assertion highlighting the motivation on the part of secret societies to *impress audiences*, whether consisting of society members, ritual guests, or the public. We will return to this topic after further examining the characteristics of secret societies. In sum, these sodalities are often found in association with several distinctive characteristics/practices, which may have been present during the Scandinavian Bronze Age. These included:

1. Ritual activity involving theatre, sacred masks, dances, along with a shared symbology with an esoteric meaning.
2. The making of rock art in the form of petroglyphs and/or pictographs.
3. Power iconography of ritual importance featuring war canoes, warriors, fighting, solar depictions, and metals (Ling 2008).
4. A regional or supra-regional iconography focused on power animals, myths, or regional interaction, and shared art styles (Goldhahn and Ling 2013).
5. Strong associations with warriors and publically or ritually staged supernatural or martial contests between individuals.
6. The procurement of exotic ritual paraphernalia, particularly metals for rituals and for fighting.
7. The creation of regional or supra-regional networks with ritual participation and exchanges.
8. Focus on surplus production and gift exchanges to establish networks of power and alliance (Earle et al. 2015; Ling et al. 2018).
9. Control of trade in valuable goods (Earle et al. 2015).
10. Esoteric knowledge about martial arts, navigation (including astronomy), and cosmopolitan affairs (Ling et al. 2018).
11. Requirements of wealth and power for membership.
12. Warriors able to raid, trade, protect, and to intimidate (Ling et al. 2018).
13. Simple decentralized ranked and/or chiefdom levels of sociopolitical organization (Kristiansen and Earle 2014; Earle et al. 2015; Austvoll 2018).

The common association between warriors and secret societies would have been particularly attractive for Scandinavian Bronze Age adventurers because society rituals proffered supernatural protection for individuals who were engaging in combat so as to ensure victory (Hayden 2018). Horned helmets may have been part of the ritual paraphernalia that was supposed to confer supernatural powers on combatants or at least in ritualized contests (see Fig. 6). Seafaring in island environments is another likely association with secret societies due to the dangers and risks involved in excursions made to attend regional rituals, procure exotic

ritual paraphernalia (as on the American Northwest Coast and Island Southeast Asia), or to control trade in valuable materials as exemplified by West African Poro secret societies (Harley 1968; Hayden 2018). Warrants of supernatural protection could have been given all such ventures. In the following section, we examine the war-related rock art themes in Bronze Age Scandinavia and its link to secret societies.

Scandinavian Bronze Age rock art

Generally, Scandinavian localities with high concentrations of rock art depicting warriors and weapons are located in coastal areas.[3] These regions were all, in the Bronze Age, linked to water transport. (Fig 4). The impressive rock art in the Tanum/Bohuslän region of Sweden faced the North Sea, while Scania, Uppland faced the Baltic and even Norrköping was linked directly to the Baltic Sea. Regarding the dating of the south Scandinavian Bronze Age rock art, various techniques have been used over the years. Currently, a dating sequence of 1700-500 BC is accepted by most scholars (Kaul 1998; Ling 2008, 2013).

Figure 4. Map showing the regions in Scandinavia marked by the presence of rock art depicting boats (after Ling and Cornell 2015).

There is no other Bronze Age region in Europe where rock art images of violence are so numerous, varied, and pronounced as in Scandinavia. This imagery includes staged fights in watercraft, combat scenes on the ground, and scenes depicting the act of killing. Most of the rock art panels that include war-related scenes were created during two separate chronological phases of the Bronze Age, Period II (1500-1300 BC), and Period V (900-700 BC) (Ling and Cornell 2015). Interestingly, these phases correlate with the circulation of the greatest amounts of metals in Scandinavia. Thus, the representation of violence on these panels dovetailed with the Bronze Age society's investments in long distance exchange of metals that in turn, spurred social inequality (Vandkilde 2006; Ling 2008; Earle and Kristiansen 2010; Ling et al. 2018). It is also important to point out that the Scandinavian Bronze Age is associated with an increased number of actual weapons being recovered along with a large number of rock art panels depicting conflict (Thrane 2006).

Since research findings indicate that Scandinavian societies obtained metal from various regions of Europe, we posit that the warriors depicted on rock panels in Scandinavian regions represent Bronze Age actors engaging in activities associated with the acquisition and/or distribution of metal that was highly coveted (Ling et al. 2014). Forming a specialized sodality of Bronze Age Scandinavian society, these "warriors" were likely involved with maritime trade, warfare, and long distance exchange (Kristiansen and Larsson 2005; Kristiansen 2016). We suggest that these warriors likely formed a type of "warrior/trader/secret society" (more on this below).

Importantly, the war-related motif is only one of several other recurring themes present in Scandinavian rock art. This war-related rock art may have functioned as a type of advertising or showing-off involv-

ing society myths or displays of bravado. However, it may have also been associated with actual violent events or ritual battles (Ling and Cornell 2015). Advertising or showing-off, whether to the public or to potential or real adversaries, have been and continue to be, important strategies in times of warfare and it is tempting to interpret these warrior images as a component of military propaganda (Ling and Cornell 2015). To use a contemporary analogy, one may consider modern day large military parades as being designed to advertise/show-off an army's strength as a type of military propaganda.

Additionally, as previously mentioned, we propose that important sectors of Scandinavian Bronze Age rock art may have formed part of a secret society's esoteric ritual practices. For instance, the majority of the panels at Tanum/Bohuslän were sculpted on horizontal rock outcrops forming the ground surface. They were not placed vertically like billboards, but were rather invisible on the landscape unless standing directly around them. This indicates that they were meant to be viewed by a select number of people who knew exactly where the sites were located, and that their symbolic content was linked to the esoterica (whether myth or history) of those standing at the site.

While there are only a relatively small number of panels on bedrock with slopes of 45 to 90 degrees, even these cases support this interpretation. The reason for this stems from the fact that locations with panels on bedrock with slopes of 45 to 90 degrees had very limited visibility of images. Today, Scandinavian Bronze Age rock art sites are often considered as being in relatively inaccessible locations. However, these sites would have been visible by boat in the Bronze Age because they would have been found along the ancient shoreline (Ling 2008). This is a result of the shore displacement and sea level change phenomena. Even if the images were painted, for which there is no concrete evidence, they would still not have been visible from the sea beyond 10-30 m. Thus, viewing such images would have been restricted to individuals with access to marine craft as well as knowledge of where to find specific rock art sites.

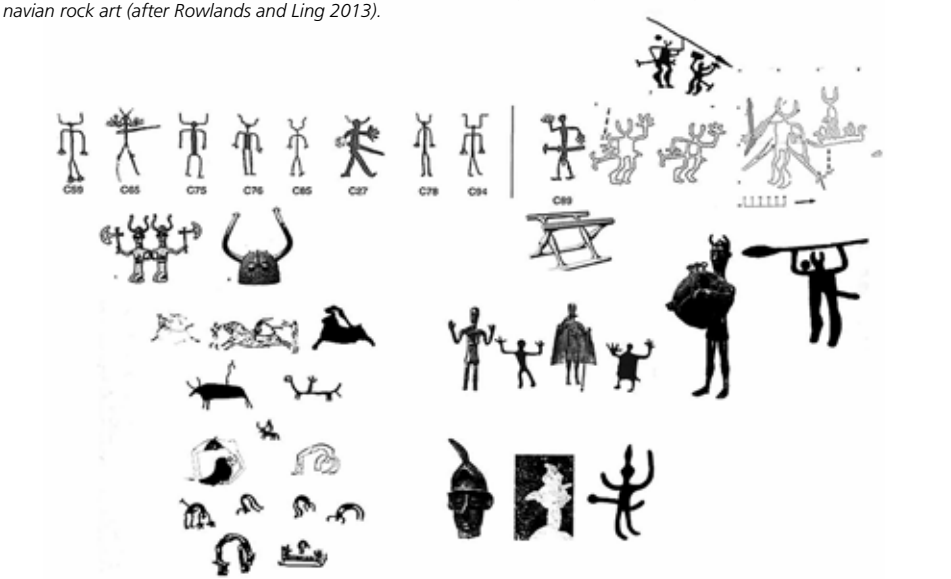
Therefore, the overall placement of the rock art in southern Scandinavia suggests the possibility that warrior/trader/secret society members from larger and perhaps even distant polities gathered and interacted at these locations. It should be stressed that the rock art was primarily a regional medium, with certain regional styles, connected to a Supra Regional Network. Additionally, the prominence/abundance of Scandinavian Bronze Age coastal rock art at certain localities indicates that these areas could also have functioned as rendezvous points for the sharing of esoteric knowledge among secret society members made up of warrior/traders that would have included individuals with expertise in boat construction and navigation as well as esoteric ritual knowledge. This is evident by cosmopolitical depictions of warriors (often dressed in ritual attire), weapons, boats, chariots, supernatural beings, the sun, and other ritual features on rock art panels or associated with boats (Kaul 1998; Kristiansen 2004; Harrison 2004 Goldhahn and Ling 2013). Indeed, some panels like the Fossum scene (Ling 2008), appear to represent congregations of 12 or more substantial boats which must have represented a gathering on at least a regional scale. (Fig. 5 and 6).

The Maritime Component of Scandinavian Rock art and Secret Societies

Many warriors and combat scenes depicted in Scandinavian rock panels have been carved in association with boats indicating a link between warriors and watercraft. As previously mentioned, much of this rock art was created close to the Bronze Age shoreline. To be more precise, at Tanum/Bohuslän, 70 percent of the known rock art sites are found at or adjacent to the Bronze Age shoreline.

Figure 5. Boats and warriors from the famous Fossum site at Tanum. Note warriors in "ritual battle" holding ritual axes of the Skogstorp type. Documentation by G. Milstreu. Hällristningsmuseum Underslös. Source: SHFA.

Figure 6. Cosmopolitan codes and features from different parts of Bronze Age Europe. Top: warriors depicted in Spanish rock art marked with the letter 'C.' Swedish rock art to the right (unmarked). Mid-section: horned figurines from Grevesvænge, a horned helmet from Viksø, and a stool from Guldhøj, Denmark. Bottom left: Acrobats and bulls from the Mycenaean world and from Scandinavian rock art. Bottom right: Nuragic warrior figurines compared with Scandinavian rock art (after Rowlands and Ling 2013).



In this context, it is notable that the rock art in general seems to have been located on the perimeter of the inner skerries in rather sheltered places, close to or at the shore of rather large inlets, bays, lagoons or natural harbors, or at strikes, isthmuses, peninsulas, and small islands (Ling 2008). During the Bronze Age, much of it would have been only visible from the water.

To date, no Scandinavian Bronze Age boats have been found, however, most scholars recognize major similarities between the Hjortspring boat (dated to 340 cal BC), and the Bronze Age vessels shown in Scandinavian rock art. This indicates a long boat-building tradition in the region (Crumlin-Pedersen 2003; Kaul 1998). As inferred from rock art depictions, the average Bronze Age boat held a crew of 7-20 individuals while some images show large vessels with crews of 40-60 individuals in boats that were likely war canoes and/or ceremonial watercraft (Ling 2008). (Fig. 7).

With regards to aggrandizers, it is tempting to associate these types of individuals with the images of very large warriors depicted on many elevated rock panels at Tanum/Bohuslän. The rock art at this location has features that may reveal the agency of special task-oriented groups. In terms of the location of Tanum/Bohuslän rock art, the following characteristics are prevalent:

- The rock art is found along coastal or maritime locations.
- Most rock art is found at ground level on bedrock outcrops that are poorly visible from a distance.
- Boats are often depicted in rock art.
- Rituals/performances are often depicted in rock art in association with boats.
- Anthropomorphic figures brandishing weapons are often depicted in rock art.

It is possible that rock art carved along coastal or maritime locations show scenes from 'maritime initiation' rites or other

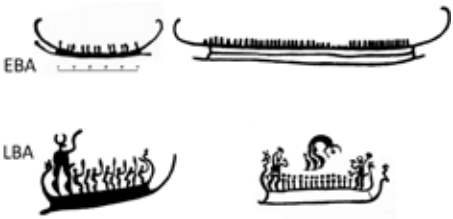


Figure 7. Crewed ships from the Early Bronze Age (top) and Late Bronze Age (bottom). Documentation by T. Högberg and G. Milstreu at Tanum. Hällristningsmuseum Underslös. Source: SHFA.

rituals that were part of a secret society of warrior/traders. That is, the initiation into this sodality may have involved the creation or display of rock art. It is likely that only members of the warrior/trader/secret society would have been allowed to witness and/or take part in esoteric initiation rites and that members were marked for recognition as initiated members with tattoos or scarification patterns as occurred in many ethnographic secret societies (Hayden 2018). Thus, this sodality or 'brotherhood' could have provided the social mechanism by which highly specialized navigational skills, boat construction methods, and likely, rock carving techniques were passed from one generation to the next.

Along these lines, we think that there are good reasons to consider that the coastal Scandinavian Bronze Age rock art depictions of warriors may represent individuals engaging in rituals characteristic of secret societies. Such depictions of "warriors" are often accompanied by images of large ships, specific ritual paraphernalia, and other exotic items. This suggests the existence of a Supra Regional Network possessing exclusive access to esoteric and exotic materials and knowledge including the use of metals as materials imbued with supernatural qualities (Ling et al. 2018, nd; Austvoll 2018).

Rock art, boat building guilds, and a Supra Regional Network

Ling et al. (2018, nd; Austvoll 2018) hypothesized that ambitious households

from the wealthy rich agro-pastoral Limfjord/Jutland region of Denmark sent their own wood craftsmen and ritual specialists to establish a timber extracting and boat building settlement in the Tanum/Bohuslän area. Some settlers could have been sent in a first wave of settlement during the Late Neolithic to Early Bronze Age while local wood craftsmen and agro-pastoralists would have likely been recruited from pre-existing local Tanum/Bohuslän communities.

The following findings point to interaction between the Tanum/Bohuslän and Limfjord/Jutland regions. Eighty-one flint daggers were recovered at Tanum/Bohuslän (Ling 2008) dating from the Late Neolithic to Early Bronze Age and these items were produced and imported from the Limfjord/Jutland region (Apel 2001). Additionally, bronzes found at Tanum/Bohuslän dating from the Early to Late Bronze Age show strong typological ties to bronzes found at Limfjord/Jutland (c.p. Baudou 1960; Vandkilde 1996). As in the case of the flint daggers, it is reasonable to assume that most of the bronzes found in Tanum/Bohuslän were transferred from the Limfjord/Jutland region during the Bronze Age. Moreover, the Limfjord/Jutland area has far more bronze finds than the Tanum/Bohuslän region. About 500% more in comparison (Kristiansen 1978; Randsborg 1968). Furthermore, lead isotope analyses carried out on the bronzes found at Tanum/Bohuslän compared with the ones recovered in the Limfjord/Jutland area show that they derive from the same copper sources, that is, from Atlantic Europe and from the Italian Alpine region (Ling *et al*. 2014, 2019; Melheim et al. 2018). Additionally, the Limfjord/Jutland area may have also served as a major transit zone for the metals arriving from central European networks via the Elbe River (Ling et al. 2019, fig 21). Thus, the relatively high number of bronzes found in the Limfjord/Jutland area as well as their shared metal signatures indicates that Limfjord/Jutland region served as the major transit zone for the distribution of metal in the direction of west Sweden (i.e. the Tanum/Bohuslän region) during the Bronze Age. The theory of the interaction between the said regions is further confirmed by the subsequent rise in magnitude and frequency of rock art and cairns in the Tanum/Bohuslän area and the rise in metals and barrows, along with the expansion of settlements in the Limfjord/Limfjord area during Period II, III and V (Ling 2008:151pp)

These are also the Periods when evidence of environmental degradation appears in the Limfjord/Jutland region. For example, pollen analysis of western Jutland samples (dating to the beginning of 1500 BC) show evidence of rapid deforestation resulting from the expansion of local agro-pastoral activities (Andersen 1999). Moreover, during Period V, there was an overall overexploitation of the soils in southern Scandinavia that spurred migration to less impacted areas (Kristiansen and Rowlands 1998). Therefore, during this time, the Tanum/Bohuslän region would have been an ideal location for Limfjord/Jutland polities to establish themselves especially given the richness of timber in the area. Moreover, in this context, it is significant to stress that Limfjord/Jutland had a considerably higher population density than Tanum/Bohuslän during these periods (Holst et al. 2013). Therefore, the combined desire for land for agro-pastoral activities, fish, and not the least timber, made the settlement of the Tanum/Bohuslän region an attractive endeavor.

Additionally, there are good indications of boat building activities at Tanum/Bohuslän in the form of what have been termed "cooking pits." Such archaeological features occur along the former Bronze Age shoreline in western Sweden. Recent excavations revealed a number of these features in the Tanum/Bohuslän area, all dated to the Bronze Age (Cleasson 2014; c.p. Lönn and Cleasson 2007; Petersson 2009). However, their characterization as "cooking pits" is undermined by the fact that archaeological excavations of the pits located by the Bronze Age shore line have

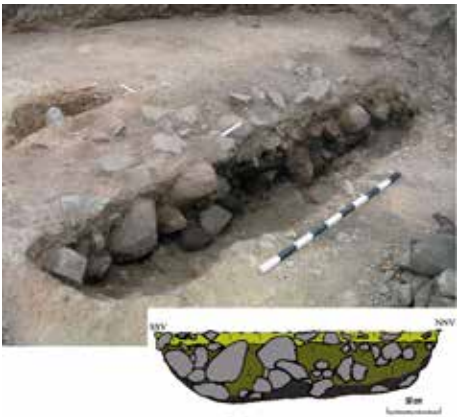

Figure 8. Large Bronze Age elongated "cooking pit" from Tossene parish in Bohuslän, West Sweden. This site, containing fire cracked stones, wood fragments, and charcoal, was excavated and documented by Johan Ling (after Ling and Ragnesten 2009).

rarly included food remains but rather, they contained burnt wood, fire cracked stones, and charcoal (Cleasson 2014; Ling et al. 2021; Lönn and Cleasson 2007; Petersson 2009; see also also https://www.kcaw.org/2016/10/06/canoe-steaming-carries-tlingit-haida-tradition). Therefore, we suggest, in line with Petersson (2009), that these fire-cracked elongated stone pits were associated with boat building activities and we provide the following support of this interpretation. (Fig. 8).

For similar use of fire in the building of boats particularly for the expansion of the log that constituted the bottom plank of planked built watercraft, see the the Hjortspring boat. (Fig. 9). Analyses of the wood found in these Bronze Age shoreline pits show that the types of wood are similar to the types that were used in the construction of prehistoric boats (Petersson 2009). Moreover, ethnographic studies document the use of fire-heated stones for the steaming of wood to be used in boat building particularly for the keel and the side portions of traditional watercraft (Clausen 1993; Ling et al. 2021). This interpretation finds additional support from the following ethnographic information collected among the Haida.

In order to gain a better understanding of traditional boat building techniques, several of the authors of this article conducted ethnographic investigations among the Haida of British Columbia during the summer of 2018. A Haida craft specialist named Christian White, who currently builds boats, informed us that traditionally, Haida boat builders used fire to heat stones which, in turn, would be placed in water.[4] Steam emanating from the heated water would be used to bend the wood used in the construction of boats. According to this traditional Haida boat builder, small fires were built near boat construction sites for the purpose of heating the stones that would be used in the wood bending process. Given these observations we think that the Scandinavian Bronze Age 'cooking pits' documented by Petersson (2009) are probably the remains of fire pits constructed for heating stones that were employed in boatbuilding activities.[5]

Returning to the nexus between Limfjord/Jutland and the Tanum/Bohuslän regions, as previously stated, we posit that Limfjord/Jutland aggrandizing households would have secured badly needed timber for boats from an extractive settlement at Tanum/Bohuslän (Ling et al. nd). This settlement would not only have provided timber for boat construction but also for

Figure 9. Photo the The Hjortspring laug (the Hjortspring boat building team) in the process of bending a log by using heat and steam emanating from an elongated fire pit. This log will serve as the hull for a log boat. Photo by The Hjortspring laug.

export.[6] Additionally, settlers would have likely included individuals with practical knowledge of boatbuilding (i.e. craftsmen) along with secret society ritual specialists possessing the esoteric knowledge (i.e. chants, magic, etc.) deemed necessary for successful outcomes.

In light of this, we suggest that some of the Scandinavian Bronze Age rock art at Tanum/Bohuslän could have formed part of specific rituals conducted for successful boatbuilding, expeditions, and/or actual events that may have taken place during the course of long distance trade expeditions. Ethnographic observations from the Trobriand Islands support this argument. For example, many rituals were conducted in association with the construction of canoes that were to be involved in the Kula Trade organization which exhibits many similarities with secret societies. According to Malinowski (1922), at every stage of the Kula Trade, starting from the toppling of the trees that were to be fashioned into canoes, specific rites were conducted by ritual specialists to ensure successful outcomes.

Tangentially, since ritual specialists and individuals with rock carving skills most likely formed part of crews, these individuals may have created images of actual events and/or foreign/exotic technologies that they had witnessed. For example, the Bronze Age rock art panel at Backa contains unmistakable images of chariots that are very similar to the chariots depicted in Iberia (Harrison 2004). To date, no Bronze Age chariots have been recovered in Scandinavia. It is possible that the chariots depicted at Backa represent a form of technology that a long distance warrior/trader/ritual specialist carefully observed and then faithfully rendered on a Scandinavian outcrop during the Bronze Age. (Fig. 10). As previously mentioned, it also seems likely that secret society members incorporated practical features of a 'brotherhood' in which they shared practical knowledge involving navigation, boat construction and watercraft maintenance.

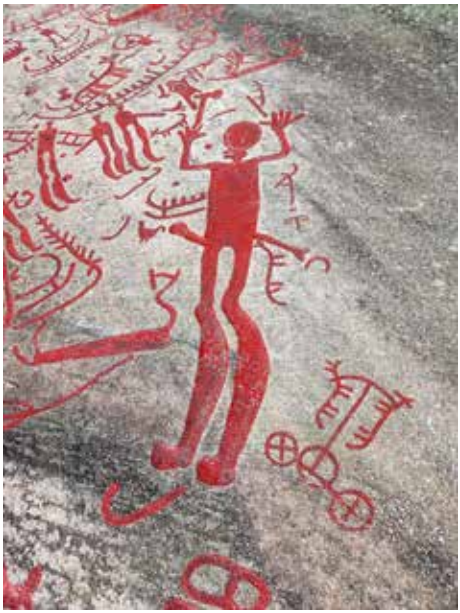

Figure 10. Depictions of warriors and chariot from Backa, West Sweden. The Bronze Age chariot carvings are very similar to the chariots depicted on Iberian rock art and also similar to archaeologically documented Mycenaean chariots. Source: SHFA.

Of considerable importance, members of such a sodality would have been guaranteed safe passage while travelling through a region inhabited by fellow secret society members.[7]

Along these lines, we posit the likelihood that Scandinavian Bronze Age rock art panels may have served as a form of cryptic messaging designed to convey esoteric information and/or foundation myths to fellow sodality members. This position finds support in the *secret language of signs* that Liberian Poro secret society members employed to communicate with associates inhabiting distant locations. Despite belonging to different ethnic and linguistic backgrounds, all Poro members recognized and honored the social standing of high ranking Poro secret society members who could thus securely travel throughout a very large region (Harley 1968). We suggest that the presence of a transregional and inter-ethnic means

of communication in the form of rock art could have facilitated long distance travel and exchange throughout the Supra Regional Network operating during the Scandinavian Bronze Age.

Pilgrimages and Secret Societies

In addition to associations between secret societies and rock art, boats, warriors, and long distance exchange, we also would like to suggest that the dense rock art locality in the Tanum/Bohuslän region may have served as a pilgrimage location for a wider region in western Scandinavia. It is clear from the ethnographies that major ritual events put on by local secret societies drew other members of the society to attend from large regions, hundreds of kilometers in radius (Hayden 2018). Where these gatherings were routinely held in or near the same village, they might be termed elite or secret society pilgrimage locations, and they may well have involved the creation of shrines, architecture, and art of various types including rock art. In Sweden, during the Iron Age, the site of Old Uppsala served as a political and ritual location where elites seasonally traveled long distances (up to 500 km) to negotiate, to compete for power, and to engage in ritual activities (Alkarp 2009; Sturlasson 2018). Other Indo-European cultures had such ritual centers like Chartres which was used for Celtic intertribal gatherings for Druids; and Druids fit all the characteristics of secret societies, including contributing their magical efforts to battles. The Phoenicians who sent out ships to procure metals, too, had a type of secret society for traders with Melqart as a patron deity. The cult priests constituted an exclusive group from the richest and most important families; they were hierarchically organized and had great political power; priests became ecstatically possessed, and they engaged in human sacrifices. They established temples at their entrepots in the Western Mediterranean where all trading transactions took place (Aubet 1993:128-9,232-5).

With these considerations in mind, we would like to raise the possibility that Tanum/Bohuslän served on a seasonal basis as a suitably remote trans-regional meeting location where secret society groups, from a wider area, gathered and made some of the rock art. The ritual activities that took place at this location would have included the initiation of new members or advancement of existing members up the hierarchy; the transmission of knowledge relating to sociopolitical affairs involving ritual, power, and warfare; and the transmission of practical knowledge related to ritual or prestige craft technology, navigation, boat construction, and watercraft maintenance. Astronomical knowledge, in particular, seems to have been an important component of the esoteric knowledge of many secret societies elsewhere in the world and would have been indispensable for navigation in the open ocean. Many scholars have also stressed that certain Bronze Age Scandinavian rock art carvings and images may be associated with arcane astronomical knowledge. For example, cup marks, ring crosses, circles, and wavy lines may denote the movements of celestial bodies and in particular, the passage of the seasons (Kaul 1998; Tilley 1999).

The kind of ritual gathering that we propose finds archaeological support in the fact that similar remote sites with elaborate art have been advanced as the best candidates for Supra Regional secret society ritual sites, including Gobekli Tepe, Lascaux Cave, and Chavin de Huantar among others (Hayden 2018). Tanum/Bohuslän appears to have been less strongly developed, but operating with the same dynamics. In addition, many items depicted on the rocks in the Tanum/Bohuslän region include bronze ritual objects, such as bronze horns, ritual axes, and ritual shields (see figure 5). See figures 11 and 12. These types of objects have not been recovered from this region presumably because of the short sojourns at this location and the subsequent dispersal of wealthy initiated members (who possessed most

Figure 11. Bi –horned warriors from the Late Bronze Age blowing bronze horns at the Kalleby site at Tanum 405. Documentation by G. Milstreu, Tanum Hällristningsmuseum Underslös. Source: SHFA.

of the bronze) to their respective destinations carrying their bronzes with them after the termination of the ritual gathering. However, the rock art that displays their bronzes remained in place for all members to see. The secret society would have vaunted its ability to acquire and use a sacred metal like bronze. In contrast, bronze objects such as bronze horns, ritual axes, and ritual shields have been found in the Limfjord/Jutland area which consisted of permanent residential communities that engaged in rituals and displays of bronze in their homes, villages, cemeteries, and regional centers (see also below).

This finding suggests that elites from the Limfjord/Jutland region probably would have participated in the seasonal brotherhood gatherings in the Tanum/Bohuslän region to engage in major regional rituals in which rock art played a central role.

The importance of location

Geographically speaking, the Limfjord/Jutland region was situated in a very strategic location in the Bronze Age. Moreover, the possession of sea worthy boats by local aggrandizing households, would have permitted raiding parties to ply Scandinavian

Figure 12. The Kville 124 rock art site. Warriors brandishing ritual bronze shields with an acrobat nearby. Documentation by G. Milstreu, Tanum Hällristningsmuseum Underslös. Source: SHFA.

coastlines with the goal of taking captives. In turn, these same boats would probably have transported slaves and badly needed timber from northern Scandinavia to Jutland in the south.[8]

Limfjord/Jutland households which sponsored the settlement of Tanum/Bohuslän would likely have distributed many types of prestige goods to supporters including boats and timber along with a portion of captured slaves. Profits generated from these transfers could be used in turn to fund costly long distance trading expeditions to secure metals from the south. Such expeditions would have used boats built in the Tanum/Bohuslän area. These watercraft appear to have been manned by warrior/traders along with ritual specialists. The bulk of the slaves (that were captured along northern European coast) and perhaps other commodities such as amber were likely transported southwards in exchange for metals. We think it is worth considering that many, if not all, crew members (or their closely affiliated kin and/or supporters) on these long distance exchange expeditions may have been members of a secret society. Alternatively, only the owners of the boats and high ranking members of the crew may have been secret society members with the rest of the crew and specialists simply being contracted to perform services.

In summary, Limfjord/Jutland's strategic location allowed local ambitious households access to a network that would have given them the ability to obtain coveted metals originating from sources to the south. This would have been the case because the Danish isles held a favorable position in terms of metal supply coming through the riverine routes of the Oder and Vistula and overland routes from Central Europe.[9] Moreover, permanently resident and wealthy Limfjord/Jutland aggrandizers in all probability would have fostered loyalty by rewarding faithful appointees in the Tanum/Bohuslän settlement with gifts of metal obtained from the south. This hypothesis provides a possible explanation of why so many depictions of metal artifacts appear on Tanum/Bohuslän rock panels (i.e., functional and ritual swords, axes, lurs, shields, broaches, etc.) while relatively few metal artifacts have actually been recovered in this region (Malmer 1981). In contrast, numerous metal objects have been recovered in the Limfjord/Jutland district (Kaul 1998). The metal objects appearing on Tanum/Bohuslän area rock panels may simply represent the use of such items in oral histories of events back in Limfjord/Jutland, or representations of *items and outcomes that were highly valued and desired* by the sponsoring Limfjord/Jutland households and secret societies. Moreover, secret society members may have carved panels showing historical, mythological, or hoped-for victorious warrior/traders/ritual specialists returning from distant battles with captives or, as depicted in one instance, a boat appears to be transporting a metal "oxhide" ingot from a trading expedition. (Fig. 13).

As previously mentioned, successful expeditions/raids provided ambitious Limfjord/Jutland households with the necessary commodities (boats, slaves, and timber) needed for securing metals from the south. The subsequent distribution (likely in the form of potlatch-like competitive feasts) of highly coveted metals originating from the south mostly went towards the supporters of the sponsoring aggrandizing households residing in or near the Limfjord/Jutland district. It is reasonable to propose that members of the households that underwrote ship building and seafaring expeditions also occupied leadership positions in local secret societies together with local political structures.[10] With this hypothetical scenario in mind, the rise of power of certain ambitious households in northern Jutland's Limfjord district during the Bronze Age can be considered as a logical outcome, as discussed below.[11]

Discussion and Conclusions

This interdisciplinary approach involving archaeology, ethnology, history, sociology,

Figure 13. Depiction of an oxhide ingot on a ship dated to 1400–1300 BC, from a rock art panel in Norrköping, Sweden. Photograph by Catarina Bertilsson. Source: SHFA.

and ecological data has yielded findings indicating that during the Bronze Age, ambitious agro-pastoralist households from the deforested Limfjord/Jutland area established a timber extracting settlement in the Tanum/Bohuslän region. As one of the most productive and rich locations in Bronze Age Scandinavia, the Limfjord/Jutland region had considerable wealth that may have been used to establish secret societies involving other Supra Regional groups to promote and control maritime trade. As the premier ship-building region, Tanum/Bohuslän may have been chosen for major ritual gatherings involving other regional "chapters" of the secret society that formed a Supra Regional Network. The most important role of this ritual sodality was probably to facilitate the socio-economic and political interactions that took place in the area, settle disputes, and guarantee safe passage, lodging, and transactions for all members throughout the network (Ling et al. 2018, nd).

In our reconstruction of the maritime complex which is being considered here, the extractive Tanum/Bohuslän settlement likely included agro-pastoralist families that could have provisioned a sodality of warrior/traders/ritual specialists who built and navigated boats, secured timber, and raided for slaves. Ambitious Limfjord/Jutland households appear to have directed the importation and subsequent distribution of timber in the Limfjord/Jutland region. By doing so, many Limfjord/Jutland co-residents which had received timber would have become indebted to these households. In turn, the socially, politically, and economically upwardly mobile Limfjord/Jutland households would have been able to count on support from their indebted co-residents who would have provided help in organizing and provisioning long distance metal-securing trading expeditions to the south.[12] Upon the return of a successful expedition, these same aggrandizing Limfjord/Jutland households would have overseen the distribution of

metals to local supporters and to a relatively small number of loyal appointees who were probably fellow secret society members in the Tanum/Bohuslän settlement.[13]

Through these actions, certain ascending Limfjord/Jutland households operating in the Supra Regional Network (forged by secret societies), successfully made use of both agro-pastoral and nautical sectors of the economy. Through time, these ambitious Limfjord/Jutland households generated large profits via the importation and distribution of timber, slaves, and metals. The accumulated wealth, prestige, and power of these timber-slaves-metals exporting/importing Limfjord/Jutland households (which we suggest also occupied leadership positions in local secret societies and dominated local or regional politics) grew over time while the indebtedness of timber, slaves, and metal consuming co-residents also increased.[14] This trend allowed these aggrandizing Limfjord/Jutland households to eventually consolidate political power. We believe that this was the process that transformed Bronze Age Scandinavian societies of the Limfjord/Jutland region into ranked and perhaps, even chiefdom level polities (Ling et al. nd).

Lastly, we wish to reiterate the value of employing an interdisciplinary approach when seeking to understand the nature of Bronze Age Scandinavian rock art or when trying to comprehend how social complexity may have developed in the region. As is illustrated in this article, such collaborative approaches can greatly enhance our ability to understand the possible processes that took place back in prehistory.

Acknowledgements

The authors of this study would like to thank Sea and Society at the University of Gothenburg for the grant we received which enabled us to conduct this research. Richard Chacon, Johan Ling, and Yamilette Chacon are particularly grateful to Professor Brian Hayden for his guidance in matters dealing with secret societies. We are also most grateful to Gwaai Edenshaw (Guujaaw), Jags Brown, and Christian White for sharing their knowledge of Haida culture and traditional boat building techniques.

Dr. Richard Chacon (Winthrop University)
Prof. Johan Ling (University of Gothenburg)
Dr. Brian Hayden (Simon Fraser University)
Dr. Yamilette Chacon (James Madison University)

Notes

[1] Interestingly, animal pelt headdresses (particularly those that included birds) often also formed part of the sacred regalia of Mississippian secret societies (Dye 2017).

[2] For a rigorous study of secret societies, consult Hayden (2018).

[3] The Scandinavian landscape has been transformed by shore displacement. This displacement indicates that many rock art sites (which are found inland today) were located along the coast during the Bronze Age.

[4] According to this Haida master craftsmen, this process was not without its hazards as super-heated rocks would sometimes crack when placed in water and individuals standing nearby during this process could be struck by rock fragments traveling at high speeds (R. Chacon's unpublished fieldnotes, n.d.).

[5] There is a major difference between the traditional Scandinavian plank-built boats and the traditional log boats of the Haida, even if they are of the same size generally speaking. Haida boats are cut from a single log while while Scandinavian watercraft are comprised of several parts. However, both boat building traditions employ the same elementary steam techniques to either bend the bottom plank and to soften the planks so they can be

bent in the direction needed or to expand the boat.

[6] According to Ling (2008), Scandinavian Bronze Age boats could carry up to 1 ton of cargo so the transporting of large quantities of timber during this time period was most certainly possible. In order to reduce weight, timber could have been transported as wooden planks or logs could have been floated alongside the hull.

[7] The Chumash Indians of southern California conducted maritime exchange using a native plank canoe *(tomol)* that was capable of traveling great distances over open ocean. Among this indigenous group, existed an institution known as the "Brotherhood of the *Tomol*" which afforded safe passage to its members. Given the fact that the Chumash engaged in warfare and ritual violence, the presence of this type of secret society likely facilitated trade in the region (Blackburn 1980; Fagan 1995; Johnson 2007).

[8] Consult Ling et al. (2018, nd) for evidence of slavery in Scandinavia during the Bronze Age.

[9] This scenario finds support in the following: According to recent research, a high percentage of Early Bronze Age metal found in Sweden originated from Central and Western European sources such as the Alpine region, the British Isles, and Iberia (Ling et al. 2014).

[10] According to Hayden (2016:11), "… secret societies typically used expensive paraphernalia often from distant sources; they controlled and consumed vast resources; they were regional in scope; they provided regional mobility…[they] engaged in feasting, the largest events being used to publicly display their supernatural and profane powers."

[11] This hypothesis also explains the relative paucity of Bronze Age metal artifacts recovered in the Tanum/Bohuslän area. Additionally, since timber harvesting and boat building could only have taken place during warm periods, it is likely that inhabitants of the Tanum/Bohuslän settlement only resided at this isolated location during the summer months. This hypothesis also explains the scarcity of large settlements in the Tanum/Bohuslän region during the Bronze Age.

[12] See Chacon and Hayward (2017) for documentation of how aggrandizers operating in transegalitarian settings, employ debt to forge large and powerful coalitions.

[13] These distributions likely took the form of potlatch-like competitive feasts which not only enhance a sponsor's prestige but place all receivers of 'gifts' in debt. For an ethnographic example of this strategy, see Chacon and Hayward (2017).

[14] According to Dye (2017:85), "[t]he successful ritual sodality member, based on their acquired powers through dreams/visions mediated by animal dream-spirits, enjoyed honor, prestige, and social visibility, attributes which opened political leadership opportunities."

A PHOENICIAN ALPHABET ON SUMATRA[1]

E. E. W. Gs. SCHRÖDER

TAROETOENG, SUMATRA, DUTCH EAST INDIES

A.

1. SINCE THE WORK of Taylor (hereinafter designated as *N*) and of Bühler (*B*), the origin of the alphabets used on the continent of India is certain. They have sprouted from branches of the Phoenician alphabet.

2. Professor E. J. Rapson (*J*) remarks: "Both of the alphabets now usually known as Brāhmī and Kharoṣṭhī are of Semitic origin; that is to say, they are derived ultimately from the same source as the European alphabets. They were introduced into India at different periods, and probably by different routes. Brāhmī is found throughout the sub-continent and in Ceylon. The home of Kharoṣṭī is in the Northwest; and whenever it is found elsewhere it has been imported.

"Brāhmī has been traced back to the Phoenician type of writing represented by the inscription in which Mesha, King of Moab (*c.* 850 B. C.), records his successful revolt against the kingdom of Israel. It was probably brought into India through Mesopotamia, as a result of the early commerce by sea between Babylon and the ports of Western India. It is the parent of all the modern Indian alphabets.

"Kharoṣṭī is derived from the Aramaic script, which was introduced into India in the sixth century B. C., when the Northwest was under Persian rule, and when Aramaic was used as a common means of communication for the purposes of government throughout the Persian empire. That originally the Aramaic language and alphabet pure and simple were thus imported into Gandhāra, as Bühler conjectured in 1895, has been recently proved by Sir John Marshall's discovery of an Aramaic inscription at Taxila. When the first Kharoṣṭī inscriptions appear in the third century B. C., the alphabet has been adapted to express the additional sounds required by an Indian language; but unlike Brāhmī, which has been more highly elaborated, it still bears evident traces of its Semitic origin both in its direction from right to left and in its imperfect representation of the vowels."

3. As many products of the civilization of the Indian Archipelago show themselves under the dominant influence of the Indian continent, so also in explaining the existence of the alphabets on those islands that influence is supposed to have been supreme. India has acted as a funnel.

4. Taylor (*N* II. 287-288) enumerates, after elimination of non-indigenous alphabets, on the continent of India:

"a. Nearly a score descended from the sacred Devanāgarī script in which the Sanskrit literature is mostly conserved.

"b. Others derived from the Pali, the old alphabet of the Buddhist scriptures.

"c. At least a dozen belonging to the southern, or Dravidian, family of alphabets.

"d. Nearly as many to the Gujerati, or western, type.

"e. Others to the eastern, or Bengali, class."

There seems thus to be ample choice, but practically the number is very limited.

5. This we see, as for the island of Java, from Taylor (*N* II. 359): "The modern alphabet of Java, which is also used in Borneo, is proved . . . to belong to the Pali class (*N* II. 346). The old Pali, as exhibited in the Kiousa character of Burma, and the Kawi inscriptions of Java, seems to have been derived from a very ancient type of the western alphabet of India (*N* II. 347-348). The old Kawi, on which the modern Javanese is based, is known from copper-plate grants of the 9th and 10th centuries. . . . The alphabet of these inscriptions is a legible Pali of the same general type as the Burmese Kiousa alphabet. This ancient Kawi alphabet of Java is there called the Akchara Buddha, or 'Alphabet of Buddha,' a name which proclaims its introduction by the Buddhist missionaries. The modern Javanese has additional letters derived from an earlier alphabet, belonging to the type exhibited in the Assam inscription (*c.* 9th century), to which the Malay and the cursive Siamese also belong."

6. As for the other islands, Taylor remarks (*N* II. 359): "The Malay alphabets, which extend over the other islands of the Asiatic archipelago, are of more doubtful origin. The principal alphabets used by the Malayan races are the Batak, the Rejang and the Lampong, the Bugi and the Macassar, the Tagala and the Bisaya. These alphabets appear to have been derived from at least two distinct sources. Holle has shown reasons for supposing that the alphabets of Sumatra are only degraded types of the old Kawi. The Eastern Malay alphabets have a different history. Their prototype seems to be the Eastern cursive alphabet, which is represented by the Vengi and Chalukya inscriptions in the South and by the Assam inscription in the North—the Tagala may be taken as the type of the Eastern Malay alphabets."

7. The Vengi and Chalukya types originated in the Deccan. The first dates from probably the 4th or 5th century A. D., the second from the end of the 6th.

8. About the Tagala alphabet Taylor writes (*N* II. 360): "The Tagala alphabet must have been obtained from the Eastern coast of Bengal at some time prior to the 8th century A. D. That it was conveyed by mariners who ventured on distant voyages, is indicated by the fact that the oldest forms of the Malay letters are found in the islands which are most remote from the Indian shores.

(*N* II. 361): . . . the Tagala is the prototype from which the alphabets of the Celebes and Macassar have been derived."

B.

9. After this introduction we shall confine ourselves to Sumatra. The indigenous alphabets of this island are connected with those of the continent of India in many respects, among which are the method of indicating the vowels and the creation of different forms of the consonants in combinations of letters and ligatures, the latter phenomenon being of unlimited productivity. We refer, without going into details, to forms for *ć, j, n;* sometimes for *š, nć, nj;* at times for *ṅga, ṅka, nda, nta, mba, mpa, nra, nsa, ṅsa;* to different aspirations; to signs for final *-an, -in, -un, -am, -iṅ, -uṅ.*

10. All those elements which are foreign to the Phoenician alphabet can ultimately be compared with elements in the alphabets of India but not with elements in the Phoenician alphabet, except in some cases of direct adaptation, which are therefore of interest in that respect.

11. For the purposes of this paper all those forms may be ignored. Our purpose is not to investigate the development of the Austronesian alphabets in general—which in itself would be interesting and worthwhile—but to see whether in some of those systems of writing, especially those of Sumatra, there exist sufficient data to fix the period at which they were first adopted, and whether they *must* have come to Sumatra through India or if they could have come from Phoenicia directly.

12. If we consider the several indigenous alphabets of Sumatra, we see that they contain respectively the number of characters indicated in the following table:

Batak	Krinchi	Rejang	Lampong	Musi-Ilir	
16–18	27–28	28	18	28	Consonants
5	4–6	2(?)	5	12	Vowels and other sounds

From this it is clear that Batak and Lampong show the simplest forms, and therefore in any comparative treatment should be examined first. Their simplicity, it may be added, does not show any connection with the *dvādaśākṣarī,* with which, according to Hieuen Tsiang, instruction used to begin in India (*B,* p. 2).

13. For the Dutch views about Batak and Lampong, we read

This content downloaded from
50.50.104.222 on Tue, 28 May 2024 08:28:14 +00:00
All use subject to https://about.jstor.org/terms

as the latest opinion on the former (*D*): "The alphabet in which the dialects of the Bataks were written before our Latin characters were known is not an invention of their own; it is evidently a very simplified Indian script, much simpler, for example, than the Javanese script, which is of the same origin, but for the rest founded on the same principles and rules." And concerning Lampong, we read (*D*): "It is one of the forms of the Sanskrit alphabet as that alphabet developed in the Indian archipelago."

14. But we shall see, contrary to the foregoing opinion, that there has been no simplification; rather the simplicity is due to greater originality. Since the Lampong alphabet does not particularly concern us, we shall confine ourselves in the main to the Batak alphabet. So too we shall not deal with the Rejang script, to which J. Park Harrison (*F*) in 1875 for the first time called attention as agreeing with Phoenician script—a fact which I did not learn until after I had begun my investigation.

C.

15. Before going on with the main thread of the argument, we must first pause to rectify an error. The present views concerning the Batak writing are founded on what H. Neubronner van der Tuuk (*O*) said about the writing of Toba, a dialect of Batak: "Batak is written from left to right. Since the usual material for writing is bamboo, which being round can most easily be written upon lengthwise, it is also always written from bottom to top. When reading one can readily hold the writing horizontal. Thus also the Toba's method of writing, which he employs when he writes with ink and a *tarugi* on the bark of the *alim* tree, or, as after more contact with strangers, on paper, is to be ascribed to the material he uses daily."

16. The confusion of this description may be cleared away if we consider what the appearance of our own Roman manuscript would be if we were to turn it back 90° counter-clockwise. That would give our writing an appearance that might make it possible to describe it, in a confused way, as van der Tuuk described the Batak. And it was on some such basis as this that the great naturalist Junghuhn (*I*), writing twelve years before van der Tuuk, understood Batak writing. We may, therefore, correctly describe

Batak writing as follows: the Batak wrote from bottom to top, the columns following each other from left to right.

17. Since the opinion of van der Tuuk was founded on a misunderstanding existing or arising in his time, and certainly due to foreign influence, it is of no significance to us. Certain it is that to this day in the hill regions of Baros the original method of writing still exists. When considering printed Batak books this point is to be kept in mind.

18. The question arises whether the method of writing has a still greater significance, since we find preserved in the writing from bottom to top a characteristic of the greatest antiquity and originality that has everywhere else been lost; but it is dangerous to attempt an answer to the question. We refer only to Kurt Sethe (*M*): "Für die Anordnung der Zeichen gelten in der Hieroglyphenschrift sehr eigentümliche Gesetze, die sich aus der ursprünglichen Anwendung dieser Schrift in senkrechten Kolumnen mit Übereinanderstellung von Zeichen über Zeichen natürlich erklären, einer Schreibweise, die bekanntlich auch bei den Babyloniern das Ursprüngliche war und bei den Chinesen bis auf den heutigen Tag üblich geblieben ist."

19. In other alphabets (as Lampong, *G* 10-11) we also find the letters placed more or less horizontally, but it is not to be denied that there is also a tendency to place them vertically; they are somewhat inclined; and so the correction to be made is not so great as in the case of Batak, especially when we remember that in writing the letters assume an inclining, cursive character.

20. In the following, therefore, we place the letters vertically. Our authorities are: (1) Junghuhn (*I*); (2) Taylor (*N* II. 240-241), for so-called old and new Batak; (3) Holle (*G* II. 20, 29), for different Batak dialects, distinguished as Mandailing, Angkola, Toba, Dairi; (4) Joustra (*H*, p. ix), for Karo Batak.

D.

21. In the second paragraph we spoke of Aramaic script. To avoid ambiguity we must define the term. By Aramaic are to be understood those Semitic peoples which dwelt in (*N* I. 245-246) "the highland which lay to the northeast of Canaan, the 'lowland.' In its primitive acceptation Aram comprised the hill region

This content downloaded from

All use subject to https://about.jstor.org/terms

of Mesopotamia between the upper water of the Euphrates and the Tigris, as well as the tablelands of northern Syria." Taylor uses the term in this sense, when he remarks (*N* II. 24): "The Greek alphabet may have been obtained . . . from Aramean merchants of the Gulf of Antioch, who may have crept along the coast before the Sidonian sailors steered across the open sea."

22. But Taylor also uses the word in a special sense, when he speaks of the Aramean type of letters, arising about the middle of the 7th century B. C., on account of its original development in Aram (*N* I. 245-251). Thus there are contrasted the Phoenician script of Nineveh, really an Aramean town, of the 7th century B. C. and the Aramean alphabet used in the same place, of a somewhat later date (*N* I. 227, col. iii; 250, col. iii). As for the difference between them, we quote from Taylor (*N* I. 251): "The tests by which the Aramean alphabet is distinguished from the Phoenician are not difficult to define. The most characteristic feature is *the systematic opening of the loops of the closed* (Phoenician) *letters.*"

E.

23. When we look at Junghuhn's survey of the Batak letters (reproduced in our Table I), we notice how many symbols formed of straight strokes have beside them others formed of bent lines. This is a systematic extension of a phenomenon which originally was limited to one or the other, and we might deduce that it involves a principle which can be traced back to the Phoenician forms themselves. The bent forms were typical for Toba writing (*I*, pp. 259-260). In Burmese especially this bent system is still more developed (*N* II. 340-341). In making our choice of Batak forms, we have taken those corresponding to the Phoenician.

24. Of much higher interest is the fact that Junghuhn shows beside forms where all strokes are connected others which are built up of free lines; and this phenomenon must immediately be associated with what we said about the difference between Phoenician and Aramean script. It is the keystone for the proof that the Batak alphabet came to Sumatra at the time of the development of this phenomenon, between 700 and 650 B. C.

25. A third point of interest is the boustrophedon alternation

This content downloaded from

All use subject to https://about.jstor.org/terms

of the majority of the letters, in direct opposition to the Semitic system.

F.

26. A careful examination of the Batak letters forces us to compare them in Table II almost continuously with the Phoenician alphabet *of exactly the 7th century* B. C. Deviations are mentioned, with references to Taylor (*N*) where they may be found. The Roman numerals indicate the century B. C. in which the symbol is first observed.

27. The comparison with Phoenician signs must furnish the starting point of our investigations. Although the kernel of the Batak script has been preserved almost unchanged for twenty-six centuries, nevertheless the script as a whole has felt the effect of time and the contact with other civilizations. By extensive research, therefore, we sometimes find younger forms alongside of older forms, and of these the origin is ordinarily to be found in India. A comparison of the younger forms is not pertinent here.

28. The presence of the younger forms has been observed particularly in the alphabets of Karo, Angkola, and Mandailing. In the Karo land it is known that there has been Dravidian influence; in Angkola and Mandailing — in contrast with Toba — we have reminiscences of Indian influence in the way of stone images and buildings.

G.

29. We are now ready to give a survey of our comparison. As the differences from Kharoṣṭī and Brāhmī are so considerable that it is not worth while to indicate them, we merely mention the matter here and suggest that for further information reference be made to Bühler (*B*).

In our survey we ignore: (1) *aleph,* for which see sub vowels; (9) *teth,* a letter not found in Batak; and (19) *qoph,* which letter could not exist in Toba, as that dialect does not distinguish the sound *k*.

The different letters will be found in the places referred to in the notes with the Table. The most striking forms have been chosen.

30. For the limited purpose of this discussion we remark that with the exception of (2) *b,* (6) *w,* (11) *k,* and (20) *r* Phoenician

This content downloaded from
50.50.104.222 on Tue, 28 May 2024 08:28:14 +00:00
All use subject to https://about.jstor.org/terms

and Batak show such complete uniformity that any consideration seems superfluous. Fourteen of the seventeen Batak consonants are nearer to the Phoenician source than to any known Indian alphabet. An interchange between *d* and *t* the reader will understand for himself. In regard to the sign for Batak (16) *ng,* we remark that there are in Phoenician two forms, one a closed circle, the other open. For the first compare also *G,* pp. 2-5 for the ending *-ng* of Austronesian words; for the second see also *N* II. 236 ( ).

31. A discussion of the similarity between Batak *b* and *w* and the Greek forms is not pertinent here. The sound (11) *k* is not found in Toba. It seems that the form of Mandailing *k* is that of (5) *h* with two distinguishing bars.

32. While many interesting remarks could be made concerning the data assembled in Table II, we permit ourselves some explanation only of the letter (20) *r,* to show, by a single example, the great value an exact examination of *all* the Austronesian alphabets promises for science.

Although the similarity between Phoenician and Batak *r* is so great that there can be no doubt of their common origin, an examination shows difficulties. The Batak letter itself is formed of a pennant, like that in (3) *g,* combined with a simple stroke. This combination possibly shows that this stroke was put beside the pennant, that is the *g,* for "some distinction"; and this supposition is supported by the fact that square Pali (*N* II. 341) has only the pennant in a form corresponding to the pennant of the so-called old Batak of Taylor (*N* II. 341).

A parallel appears in Cadmean, where the sign for *d* and *r* was nearly the same ( ), and here to distinguish the *r* a stroke was affixed which produced a sign that is in use to the present day ( ). See *N* II. 106.

Such agreement in method might be accidental in the case of scripts so widely separated geographically as are Cadmean and Batak, but the fact that the time of transference for both must have been about the same (6th and 7th centuries B. C.) raises the question whether they could not have had a common source. Further, we are reminded of the hieratic sign for *r* (, see *N* I. 99), which is so formed that if we opened the loops we would get a letter corresponding to Batak *r* (see *N* I. 194 note, and paragraph 42 below).

This content downloaded from
50.50.104.222 on Tue, 28 May 2024 08:28:14 +00:00
All use subject to https://about.jstor.org/terms

33. But the doubled form for one letter is not confined to Batak. We give in Table III a survey of as much as seems sufficient to demonstrate our point.

With the exception of Bugis the form for *r* in each alphabet shows an agreement with the letter *g*; and this fact seems to indicate that thsee different nations themselves were troubled to distinguish between the sounds now represented by *r* and *g*.

Such a possibility would agree with the results of the researches concerning those letters by van der Tuuk and Brandes (*A*); for according to van der Tuuk's second law Malay *r* is in Batak *g*; we can add that in Nias it is *gh* (pronounced like the *ch* in German *lachen*). Thus the word for charcoal is in Malay *arang,* in Kroe (Bengkulen) *harong,* in Batak *agong,* in Nias *agho.*[2]

Therefore it is possible that twenty-six centuries ago the differentiation was still incomplete, and there existed a sound which could be represented by *ghr,* like the Arabic *ghain* or the Hebrew *cheth.* It is clear that for *this* sound only the *cheth* could have been used; and so we refer to Table II, (8) *cheth,* and find that the form of *r* in Krinchi II (Table III) is identical with that of Phoenician *cheth.*

We cannot yet draw a general conclusion, but we have shown that the confusion of sounds and letters *can* at some time lead us to the same certainty about laws of sound in the Austronesian languages that we have reached in the Indo-European languages.

34. The identity of (21) *š* and *j* is proved when we observe that in Phoenician there were two forms for that letter (Table II, columns b and d), of which one is represented by Batak *j,* and the other by Lampong *j* (*G,* p. 10, no. 122). The existence in the two dialects of both these Phoenician letters side by side is another indication that the script was brought to Sumatra in the 7th century B. C. (see *N* I. 236).

H.

35. We have seen that in Batak the majority of the consonants are written with symbols that can easily be supposed to have been borrowed from Phoenician. It is interesting now to see how Phoenician characters representing sounds not existing in Batak were adapted to represent Batak sounds not existing in Phoenician.

[2] The Sephardic pronunciation of ע was *ng* (J. A. M.).

The comparison is even more interesting when we observe at the same time the changes made on the continent of India in effecting the same adaptation. The relation of the Batak script to the others may then be ascertained from the points of agreement and difference. We give our results in Table IV. For Asokan writing we borrow from Taylor (*N* II. 336-337), for Kharoṣṭī from Bühler (*B*, p. 22).

36. A certain uniformity between Batak (the elder) and Asokan (the younger) is proved by the correspondence of three sounds, but two others have diverged. The divergences are of more importance than the correspondences. This might be a proof of the direct transference of the Batak script from the Phoenician, but by itself it is not sufficient in view of the correspondences.

The alphabet of the Bataks proves by its forms, which are positively not Aramean but form a transition stage between Phoenician and Aramean, that the period of its transference was between the beginning and the end of the 7th century B. C., and we can therefore extend the geographical limits of the Phoenician alphabet to the Indian archipelago.[3]

---

[3] Some very interesting hints will be found in my Nias publication of 1917 (Leiden: E. J. Brill), although the question did not then have its present aspect.

As for Nias I note such words as the following:

Nias, *madala*, "planet"; Hebr. *mazzāl*, "planet" (II Kings 23. 5).

Nias, *harèsō*, "gold, of special quality"; Ass. *ḫurāsu; Hebr. ḫārūṣ*. In Aram the form must have been, via *ḫārūṣ, ḫārīṣ*. Concerning this word we find in Schrader, *Sprachvergleichung und Urgeschichte* II. 35, "Als die Vermittler dieser mykenisch-semitischen Goldschätze wird man für Griechenland immer in erster Linie die Phönizier bezeichnen dürfen, deren Fahrten nach den östlichen und südlichen Küsten Griechenlands schon im XVI Jahrhundert begonnen haben, und bei denen, wie neuere Inschriftenfunde lehren, *ḫarûṣ* das gewöhnliche Wort für Gold war."

Nias, *huku*, "law"; Hebr. *ḫoq* (Ezek. 45. 14). See also Schröder, *Phoenizische Sprache*, p. 132.

Nias, *rakō*, "einen Bund beeidigen"; Hebr. *kārōt* (Neh. 10. 1).

Nias, *suwà, subwà* (Nias, 366); Hebr. *šbu'āh*, "oath" (Gen. 24. 8; 26. 3).

Nias is a vocalic language, and therefore all syllables are opened by adding a vowel or discarding a consonant.

*Sea loans at Ugarit**

The sea or bottomry loan was one of the more unusual business loan transactions employed in Graeco-Roman antiquity. It was used to finance transmarine trading voyages. The aim of this paper is to present and dicuss the evidence which indicates the existence of bottomry loans at Ugarit and neighboring states during the second half of the 2nd millennium B.C.

One of the more unusual business loan transactions to have been employed in Graeco-Roman antiquity and that survived into the Middle Ages and early modern times was the sea or bottomry loan, called in Latin the *faenus nauticum*[1] or *traiectitio pecunia*.[2] This type of loan, which was used to finance transmarine trading voyages, was distinctive in two ways. First, the creditor assumed the risk of the loss of the security for the loan which was in this case the vessel making the trip or its cargo or both, and, second, the creditor's right to demand repayment of the loan was legally tied to a particular event which had a profit potential, i.e., the safe arrival of the ship and cargo. In ordinary loans, if money was loaned to buy income property, and the buildings purchased with the borrowed money burned down, the lender's right to demand repayment was in no way diminished, or if a man borrowed money and purchased slaves with the hope that the slaves' productive capacity would generate income to pay off the loan, but the slaves ran away, again, the lender could still demand his money. Not so the bottomry loan. Although the specific terms of the contract varied from place to place and from one people and epoch to another, generally speaking, the transaction operated in the following manner: A shipowner or lessee of a ship would borrow a sum of money to either repair or outfit a ship or to acquire cargo for a one-way or round trip voyage. The loan was secured by hypothecating the ship, the cargo, or both. The obligation to repay the loan became due within a specified time—usually twenty days—after the ship and cargo safely arrived at the destination stipulated in the contract. If the security became lost at sea due to pirates, storms, or some other disaster in which there was no evidence of negligence or criminal or fraudulent intent on the part of the borrower, then the obligation to repay the lender with respect to both the principal and the interest was automatically cancelled.[3] If the cargo was partially lost, repayment of the loan was usually on a *pro rata* or *ad valorem* basis. It also must be understood that the application of the money is seldom referred to in the Graeco-Roman documents—only that a ship or cargo was being hypothecated, and the loan will be repayed upon the safe arrival of the ship.

Our sources do not give us any reasons why these extraordinary concessions were extended to the borrower. One can speculate that the shipper could not be expected to pay money he did not have if his vessel was lost at sea, and the shippers were able to convince bankers and financiers that even though far-ranging international commerce might have been necessary to a particular local economy, the extraordinary risks to life and property to make a profit navigating the high seas had also to be acknowledged. Therefore, ships would not sail without additional financial protection. Viewed in this light, the *faenus nauticum* may be considered not as a loan *per se* but as a kind of maritime insurance in which the money advanced to the shipper served as an idemnity against possible loss, and if no loss occurred, the lender could expect repayment at an amount in excess of the customary or statutory interest rates set for ordinary loans.[4] Before Justinian, the interest rate for ordinary loans was limited at twelve per cent with no limit for maritime loans. In 528 A.D., the interest ceiling was lowered and maritime loans were limited at twelve per cent.[5]

The most complete statement we have of ancient maritime law can be found in the various parts of Justinian's

---

* The core of this article was originally presented as a paper at the annual joint meeting of the Midwest Branch of the American Oriental Society and the Midwest Section of the Society for Biblical Literature held at the University of Notre Dame on November 12-14, 1972. The author is most appreciative of all comments and criticisms both publicly and privately tendered. Errors that remain are his own.

Corpus Iuris Civilis. The sea loan was only one aspect of maritime law the *Corpus* touched upon. The ancient Roman jurists also discussed such problems as shipwreck, cargo liability, jettison, slavage, and injuries.[6] That these subjects should be of interest at all to the Roman jurists is most striking when one considers that the Romans were not the sea-faring people that the Greeks, Phoenicians, or Ugaritians were. The Roman maritime law was probably an appropriate adaptation of the laws and usages of the various sea-faring peoples the Romans had come to know or conquer.[7] Two statements from the *Corpus Iuris Civilis* illustrate this probability. In commenting on a shipwreck case, Volusius Maecianus, a jurist of the latter part of the second century A.D. cited a pronouncement in Greek by the Emperor Antoninus Pius which stated: ". . . let this matter be decided by the maritime law of the Rhodians, unless our own laws conflict with it. Such the divine Augustus ordained."[8] A section of the *Novellae* which deals with the interest rate on maritime loans calls this type of transaction "an ancient custom" (*antiqua consuetudo*) which the Roman law ought to respect.[9]

The question for us here is how ancient was the custom. The private speeches of Demosthenes and evidence from papyri show that the Greek version of the sea loan did not differ very much from the Roman. Insofar as these contracts financed international commerce, they can be considered part of the international law of the time.[10] In Athens and other cities special courts were established to hear cases arising from sea loans and similar maritime transactions.[11] The highly cosmopolitan character of these maritime transactions can be seen from a papyrus which contains a sea loan contract for a voyage from Alexandria to Punt and mentions a Carthaginian, an Elean, a Thessalonikan, and a Massiliote with a Celtic name as parties to the agreement.[12] Also, the "Greek" philosopher, Zeno, as Diogenes Laertius tells it, was actually a person of Phoenician descent from the Cypriote city of Citium. According to one account, he came to Athens as a shipwreck from a trading voyage from Phoenicia. While in Athens he was the creditor in a maritime contract worth a thousand talents.[13]

An indication that bottomry loans similar those employed in classical antiquity was also known at Ugarit and neighboring states is evidenced from cuneiform tablets excavated at Ras Shamra. In examining the relevant documents, we must keep in mind that unlike the practice in Greece and Rome, international trade was not primarily in the hands of private entrepreneurs but was, for the most part, a royal concern.[14] Thus, the parties to maritime ventures were usually kings or their agents.

The first document to be considered is a Ugaritic tablet published by Virolleaud.[15] Only the second half of this tablet of eighteen lines need concern us. The first nine lines are a list of persons who entered the house of the king.

10.	*ḫmš.mat.arb'm*	540 heavy (shekels) of
	kbd.ksp.anyt	silver (as the worth of) ships
	d.'rb.b.anyt	that were pledged from among the ships
	l.mlk.gbl	belonging to the king of Byblos,
	w.ḫmšm.ksp	and 50 (shekels) of silver
15.	*lqḥ.mlk.gbl*	the king of Byblos took
	lbš.anyth	(for) the cargo (lit. clothing) of the ships
	b'rm.ksp	from *'Arm*. The silver
	mḫr.hn	is their price.[16]

Since the opening lines contain extraneous matter, we cannot regard this document as an actual sea loan contract. What we probably have here is a memorandum of a business deal the Ugaritian king made with the king of Byblos. Since the transaction was international in char-

[16] Sasson, in his translation of this document in "Canaanite Maritime Involvement," pp. 132-33, maintained that line 13 made no sense and thus opted out for a translation that conveys the idea that the king of Ugarit was buying ships from Byblos. In the light of the sea loan, I find Virolleaud's translation of lines 10-13 more acceptable except for his preference to render *anyt* as singular. As for the remaining lines of the text, I agree with Sasson's rendition but disagree with him as to the basic meaning of the document.

acter, the contract itself was probably drawn up in Akkadian and does not survive. Under the terms of this transaction, the Byblian king borrowed a large sum of money from the king of Ugarit, with an undisclosed quantity of ships valued at 540 heavy silver shekels pledged as security and an additional 50 shekels borrowed against the cargo.[17] Whether these 590 shekels, at least 540 of them of the heavy type, corresponded to the exact amount of the principal is uncertain. It was customary among the Greeks that the value of the hypothecated property be equal to twice the principal in round trip voyages.[18]

Needless to say, a loan granted under these terms could tempt the borrower to falsely allege a disaster at sea to free himself of the obligation to repay the lender, or to intentionally destroy the pledged property. Demosthenes' private speeches disclose both of these abuses, but we shall dwell briefly on the latter one—the intentional destruction of the pledge. Demosthenes, in a speech "Against Zenothemis" tells, in part, of Hegestratus and Zenothemis who, in a clearly illegal act, hypothecated in Syracuse a ship and cargo that they knew was already pledged by someone else in Athens and thus fraudulently obtain money. They thereupon put the cash on a separate ship headed for their home city of Massilia. The two men planned to sink the illegally pledged ship and thus hoodwink their Syracusan creditors and leave the Athenian financiers high and dry. The plan went awry when Hegestratus was caught *in flagrante* before too much damage could be done to the ship. We see something vaguely similar in an account of a court proceeding bearing the seal of Puduhepa, queen of Hatti. As in classical antiquity, maritime law cases were part of the international law of the time, and as in classical antiquity, there apparently were special court proceedings to hear such cases. A transcript of the trial was sent to Ammistamru II, king of Ugarit in the mid-thirteenth century B.C.[19] In this Akkadian text, the defendant Shukku (citizenship unstated), claimed that the Ugaritian plaintiff's ship was destroyed accidentally when it struck a wharf. The plaintiff claimed that Shukku intentionally wrecked the ship. The captain of the ship was ordered to swear an oath, and Shukku had to make good the worth of the ship and its cargo. Shukku had either borrowed money from the king of Ugarit or was in the employ of someone who did in order to undertake a maritime enterprise in Asia Minor, and when it became apparent to Shukku that the obligation would not be met, he tried to sink the ship and falsely claim that an accident took place. In this way, Shukku or his employer would be free of the obligation to repay the loan, and they would also avoid possible enslavement for defaulting on a debt. Evidently, the captain of the ship caught Shukku in the act. The precise status of the anonymous Ugaritian plaintiff is hard to assess. The Graeco-Roman maritime loan contracts often stipulated that the lender had the right to place on board the ship an employee called a *kermakolouthos* whose job was to see that the interests of the lender were not criminally subverted. The Ugaritian plaintiff might have been such a representative of the king of Ugarit.[20] The motive Shukku might have had in committing this act is also difficult to determine. Flutuating prices of imported goods might have been the causative factor. In a speech, falsely attributed to Demosthenes, called "Against Dionysodorus," we are informed that two Athenians, Parmeniscus and Dionysodorus, borrowed money to go to Egypt to buy grain and resell it in Athens. Parmeniscus went with the ship and Dionysodorus remained in Athens. While in Egypt, Parmeniscus learned from Dionysodorus that number of ships laden with grain from Sicily put into the Piraeus causing prices to plunge to such a level that Parmeniscus and Dionysodorus would never have made enough money to pay back their creditors and make a profit. Parmeniscus, therefore, sold his cargo at Rhodes, and Dionysodorus told the lenders that the ship was lost at sea. In any event, it is entirely possible that we see in this document as well as in the loan memorandum discussed above a glimpse of the operations of the *ḫuburu* or trading company that was known to exist in the late second millenium B.C.[21]

In the light of these considerations, a letter written by the king of Tyre to the king of Ugarit takes on addi-

[17] Although this was a considerable amount of money, the king of Ugarit was not risking too much of his treasure in this transaction. Ugarit was one of the richest kingdoms in the area. Niqmadu II of Ugarit paid to the Hittie king Suppiluliumas 500 *gold* shekels as annual tribute. See Claude F. A. Schaeffer, *Le Palais Royal d'Ugarit IV*, Mission de Ras Shamra, Vol. 9 (Paris: Imprimerie Nationale, 1956), pp. 37-48 for a complete accounting of Niqmadu's tribute obligations.

tional meaning.[22] In this letter, the Tyrian king assured his Ugaritian counterpart that although a Ugaritian ship bound for Egypt ran aground during a storm in Tyrian waters, the ship and cargo were safe. This letter is more than simply evidence that Tyre and Ugarit were on good terms with one another. Tyrian kings were also merchant princes,[23] and they fully understood the need to protect investments especially when a ship and cargo were pledged in a high-risk venture such as a sea loan contract. The actions of the Tyrian king in personally assuming responsibility for safeguarding a shipwrecked vessel has a parallel in the Roman maritime law. In a section dealing with shipwrecks, the *Digest* provides that provincial officials must see that those living along the seashore not lure ships to their destruction or loot shipwrecked vessels.[24] The praetor's edict called for severe penalties for those who committed such acts.[25]

[23] I *Kings* 5: 8-12; 10:11, 22.

[24] *Digest*, XLVII, ix, 7.

[25] *Ibid.*, sec. 10.

Similar techniques of maritime financing were known in Mesopotamia. A. L. Oppenheim has published a number of contracts from the Old Babylonian Period referred to trade with Dilmun.[26] In these documents, the loan specifically became payable when the ship safely returned. These loans differed from the Levantine type in that they were unsecured and thus made the venture more risky for the lender. The merchant kings of the eastern Mediterranean removed speculative element from an already high risk enterprise by demanding the hypothecation of the ship and its cargo.

The evidence is admittedly scanty, but the interpretations suggested for the texts discussed here seem to indicate that the bottomry or sea loan as it was understood to operate in Graeco-Roman antiquity might also have been operative in the commerce of the merchant kings on the Levantine coast in the second millenium B.C.

JONATHAN R. ZISKIND
UNIVERSITY OF LOUISVILLE, KENTUCKY

[26] "The Seafaring Merchants of Ur," *JAOS*, 74 (1954), 8-10.

Ugaritic Mḫd — *the harbor of Yabne-Yam?*

The paper discusses the evidence mainly from Ugarit and Amarna tablets which suggests that the toponyms *Mḫd*/^{al}*Ma-ḫa-du* in texts from Ugarit are identical with the toponyms Muḫḫazu (Amarna tablets) and Egyptian *M('i)ḫś* all of which may refer to the harbor of Yabne-Yam at the coast of Canaan.

In a detailed study published some years ago, E. Y. Kutscher[1] demonstrated convincingly that the *hapax legomenon māḥôz* (*Ps.* 107:30) meant 'harbor, port' in Biblical Hebrew. His conclusions, based on the ancient Versions as well as evidence from other Semitic languages, were later strikingly confirmed by the discovery of multilingual vocabulary lists at Ugarit. Among these lists was found the following entry:[2] KAR = *ka-a-ru* = *ma-ḫa-zi* = *ma-aḫ-ḫa-*[*du* !].[3] Sumerian KAR, Akkadian *kāru* and Hurrian *maḫazi* are here equated with Ugaritic (syllabic) *maḫḫa*(*du*) 'harbor, port'. Thus, the Ugaritic and Hurrian terms turn out to be the cognates of Biblical *māḥôz* confirming the fact that this term was used to designate the harbors of Canaan at least as early as the Late Bronze age.[4]

[1] *Leshonēnu* 8 (1937), pp. 136-145. Now, see his remarks in *Leshonēnu* 34 (1969-70), p. 5 ff.

[2] Cf. *Ugaritica* V (1968), pp. 242-243.

[3] J. Nougayrol, *ibid.*, proposed that the missing last syllable be restored as [*zu*]. It seems more probable, however, both on phonetic grounds and in light of the discussion here to restore [*du*]. See E. Y. Kutscher, *Leshonēnu* 34 (1969-70), 5ff., who also argued for this restoration, as well as M. C. Astour, *JESHO* 13 (1970), 120 note 4. Most interesting is the Hurrian *maḫazi* which is either a loan-word from Canaanite or is itself the origin of the West-Semitic term. It seems unlikely that Ugaritic *maḫḫa*(*du*) and Hebrew *māḥôz* (< * *maḫâzu*) can be derived from the root *'ḥd/z* 'to hold, seize'. On the other hand, Ug. *Maḫd*/*Miḫd* (proper and common noun) is, no doubt, derived from this root. Note also R. Borger, "Hebräisch *MḪWZ* (PSALM 107,30)," *Ugarit*-Forschungen 1 (1969), 1-3. I wish to thank Prof. W. W. Hallo for calling this study to my attention.

[4] Note the use of this term in much later periods: Neo-Punic *mḥz* is translated in a bilingual inscription "*KAI* 124:2) by the Latin FORUM 'commercial center'.

Some Island Names in the Former 'Kingdom of the Isles': a reappraisal

George Broderick
University of Mannheim

Introduction

In the realm of place-names, the majority of such names in Britain are recognised as being of Celtic or Germanic origin, each comprising two main components: British (or Brittonic) or Goidelic (or Gaelic) in the Celtic group, and English or Scandinavian in the Germanic group, with wide zones where one or other of these four predominates. Despite almost four centuries of Roman occupation and several centuries of French cultural dominance following the Norman invasion of England in 1066, the Latin and Romance contributions to British place-names is comparatively small (cf. Rivet and Smith 1979). In Ireland the great majority of place-names are of Celtic (mainly Goidelic) origin, though a small number are of Germanic origin, usually English, occasionally Norse, and a smaller number still of uncertain provenance.

The combined chronological span of these three linguistic sources of our place-names, of which Celtic is the earliest, covers at most probably about 2,500 years, but the total time-span of human residence in these islands runs at least to some eight or nine thousand years in Ireland and probably considerably more in parts of southern Britain. During the vast stretch of time before Celtic speech came to Britain and Ireland, earlier peoples must have used place-names for at least the most prominent features of the landscape, and it is possible that some of these survived the shift from languages now lost to those that have survived. One such group of identifiable names consists of river names dating from a very old stage of western Indo-European, before its Celtic, Germanic and Italic branches had emerged as separate entities. Such names have been identified on the Continent by Hans Krahe (Krahe 1949–55, 1962, 1964) and extend to Britain (Nicolaisen 1957, 1982) and to Ireland (de Bernardo-Stempel 2000, 2005, 2007). These names have been described as 'Pre-Celtic' or 'Old European (*Alt-europäisch*)'.[1]

During the last Ice Age, which ended some 8,000 years ago, both Britain

[1] In his interpretation of 'Old European (*Alteuropäisch*)', Krahe refers to the Central European river names which can be etymologised in western IE, but which cannot be assigned to any particular later western IE language or language group. In the meantime, Theo Vennemann has reclaimed 'alteuropäisch' for his Vasconian etymologies (cf. Willms 2013, 129, fn. 100). For a cursory sketch of Krahes 'Old European' IE hydronomy, see ibid., 128–29.

(except possibly for the south-west) and Ireland lay under thick ice. Once the ice began to melt, people began to drift back. According to Stephen Oppenheimer (2007, 118), such early arrivals into Britain and Ireland following the Ice Age came from two main areas: (1) from either side of the Pyrenees in southern and eastern France, the Basque Country and northern coastal parts of Spain, and (2) from the Ukraine via Germany or Scandinavia. The Celtic, Germanic and Romance-speaking settlements in Britain and Ireland within the last 2,500 years represent intrusions into this periphery from the east, from central Europe and beyond, ultimately from the western Ural area where the Indo-European languages are believed to have arisen (cf. Gimbutas 2000). Other possible intrusions (on a much smaller scale) from beyond the peripheral lands of western Europe are those represented by the activities of the prospectors for metal who seemingly reached Britain and Ireland during the second millennium BC. If they came, as seems probable, from more developed areas, such as the Phoenicians from the eastern end of the Mediterranean, where they would almost certainly have spoken some variety of Northwest-Semitic, the language stock of which Ugaritic, Hebrew and Punic are later forms, then it would be reasonable to expect that such prospectors and traders would have named the principal landmarks in their own language, and that their names for such prominent geographical features, such as bays, promontories, islands, mountains etc. that may have served as landmarks, might well have entered the later Celtic languages. In this regard we must assume that any other pre-Celtic place-names that have survived derive from the unknown languages of the older peoples of the Continent and beyond who came to Britain and Ireland during the course of time.

It is in this context that the following discussion will take place. In this regard we shall confine ourselves to an area of the British Isles that may possess early names of uncertain origin, namely, to the islands that made up the former Scandinavian 'Kingdom of the Isles'[2] (i.e. Man and the Hebrides), or *Sodorenses*, to see whether we can offer satisfactory solutions today to names that may have caused us problems in the past. The running-order will start with Man, then

[2] The 'Kingdom of the Isles' is a 10th-century Scandinavian construct comprising the islands of Man and the Hebrides, with its base in the Isle of Man. Control of Man and the Hebrides meant control of the Irish Sea and the Minch, i.e. the trade route between Dublin and Norway. Therefore control of the kingdom was necessarily (initially at any rate) in the hands of Scandinavian settlers in Ireland, principally in Limerick, then in Dublin. An independent dynasty, founded by the strong king Godred Crovan c. 1079 in Man, ruled Man and the Isles – from 1156 onwards, Man and the northern Hebrides only – until the demise of the kingdom in 1266 (cf. Broderick 1980, McDonald 2007).

with the name for the Hebrides itself, followed by most of the individual main islands from Lewis to Bute.[3]

1. MAN

Pliny (fl. 23–79 AD) NH IV, 103 *Monapia* [**Manavia*],[4] Ptol. (c. 150 AD) II, 2, 10: Μοναοιδα {Monaoida} [**Monaua*], var. Μοναρινα {Monarina}, Paulus Orosius (fl. 415) I, 2, 82 *Mevania* [**Menavia*], Julius Honorius (5th c.?) *Cosmographia* 16: *Mevania* [**Menavia*], var. *Mebania, Meubania*, Jordanes (fl. 550) *Getica* I, 8: *Mevania* [**Menavia*], var. *Evania*,[5] Ravenna Cosmography (early 8th c.) 108, 19: *Manavi*, Bede HEGA (731) II, 5 (via Orosius): *Mevanias* (acc. pl.) as in [...] *Mevanias Brettonum insulas, quae inter Hiberniam et Brittaniam sitae sunt. Anglorum subiecit imperio* '(King Edwin) subjected to English rule the Mevanian islands of the Britons, which lie between Ireland and Britain'.[6] Bede's use of the (acc.) plural here apparently refers both to Man and to Anglesey. ON (H: MBS 28–29) *Manverjar* 'people of Man island', Fordun II, 10 *Eubonia* now *Mannia*, MWIS §2 *Isle of Man*. G *Manainn, An t-Eilean Manainneach* 'the Manx island', (formal) *Eilean Mhanainn*, MxG *Mannin*, (formal) *Ellan Vannin*.

● Isle of Man. The name Man is now generally acknowledged as probably[7] deriving from IE **men-, *mon-* 'protrude, rise', cf. ModW *mynydd* 'mountain' < **monijo-* (cf. LEIA s.v. *muin*), with suffix **-aua*, the sense being 'mountain island' or 'high island', i.e. protruding out of the sea, as seen either from the sea or from adjacent coasts (cf. also PNRB 411, Sims-Williams 2000, 7, Schrijver

[3] Richard Coates addresses a similar theme in *Nomina* 35 (2012), 49–102, essentially a re-presentation of the original article in Coates 2009, with minor adjustments and additional material.

[4] Pliny in fact has *Monapia* which originally would have been something like *Manavia*, as the MW name *Manaw* demands, as the British etymon would likely be **Monău̯iā* or **Manău̯iā* (cf. Jackson 1953, 376, PNRB 410). In view of the *-ia* forms in the sources the first form is to be preferred. Ptolemy's form also requires modification from *Monaoeda* to **Monaua* (PNRB 410).

[5] The forms of the name in Orosius, Honorius and Jordanes are similar in that they all display scribal metathesis of *n-v*, also in Bede, who is known to have used Orosius as source material (cf. also PNRB 41). However, the metathesis need not necessarily be attributed to the authors, but perhaps to scribal misreading of *n* as *u* in cursive script.

[6] The note about their position comes from Pliny (quoted in PNRB 411).

[7] As noted by Sims-Williams (2000, 8), the problem is that neither the sequence /mVn/ nor the /-a:/ are sufficiently distinctive for us to be 100% sure. It is well known that identical roots C1VC2- are also found in the same semantic field in unrelated languages, and in place-name studies this is particularly a problem, as we do not have sufficient semantic control, except perhaps in the case of topographically very distinctive places.

1995, 96). The same would also apply to Anglesey, Lat. *Mona*, ModW *Môn*, PCelt. **mon-* etc., but is more appropriate to Man. The earlier Welsh name for Anglesey appears to have been *Monfinnid* (= *Món-fynnydd*), now *Môn*, probably referring to Holyhead Mountain (PNRB 419–20; cf. also Broderick 2005, 337–38, 2008, 166–67).

→ 'mountain island, high island' (also PNRB 411).[8]

2. EBOUDAI – (Southern Inner) Hebrides

Pliny NH IV, 103 *Hebudes*, Ptol. II, 2, 11 Ἐβοῦδαι (Eboũdai) (pl.), Ἔβουδα {Ebouda} (sg.),[9] Almagest II, 6, 28 Ἐβούδων {Eboúdōn}, Solinus (Additamenta of later date) XXII, 12 *Ebudes*, *ab Ebudibus*, Marcian (via Stephanus of Byzantium, 6th c. AD) Ἀιβοῦδαι {Aiboũdai}, with ethnic Ἀιβοῦδαῖος {Aiboũdaĩos}; cf. OIr ethnonym *Ibdaig* < **Ebudākoi* (cf. Isaac 2005, 192).

● (Southern Inner) Hebrides (i.e. Islay, Colonsay, Jura). Meaning uncertain. No Celtic etymology known. In her discussion on the Ptolemy place-names in and around Ireland, de Bernardo-Stempel (2007, 155) sought to explain the name *Eboudai* in the context of the nearby name *Epidion*[10] (referring to the peninsula of Kintyre), suggesting that there was a development of uncertain provenance from /p/ to /b/ in the name *Eboudai*, 'for which otherwise no etymology is known' (ibid.). Isaac (2005, 192) regards the name as '[o]paque, non-Celtic, non-IE'. Watson (1926, 37–38) offers no explanation. PNRB 355: 'No etymology suggests itself within Celtic, and the name [...] may be pre-Celtic.'

Given this situation, however, and in the context of known Phoenician

[8] De Bernardo-Stempel (2007, 158) regards the forms for Man, viz Μοναοιδα and *Manávia*, as continuing 'the same original **Monavia*, i.e. **monaw(a)-yā* "the one related/near to the High one", derived from the name of the adjacent *Mona*, i.e. Anglesey [...].' The problem here, however, is one of geography, as Man is a lot hillier, and its hills much higher than the two hills in Anglesey, viz Holyhead Mountain in the west and Parys Mountain near Amlwch in the north of Anglesey.

[9] αἵ τε καλούμεναι Ἐβοῦδαι πέντε τὸν ἀριθμόν, ὧν ἡ μὲν δυτικωτέρα καλεῖται Ἔβουδα ἡ δ' ἑξῆς αὐτῆς πρὸς ἀνατολὰς ὁμοίως Ἔβουδα 'the so-called Ebudai, five in number, of which the most westerly island is called Ebuda, that east of it and adjoining to it is also called Ebuda'. Meant here are the southern Inner Hebrides, though the two Ebuda islands cannot be identified for certain, but may possibly refer to Islay and Jura.

[10] *Epidión*, gen. pl. of the ethnonym *Epidioi* < **ek-wé/idyoi* 'the horsemen', transferred from an old Cumbric name in Scotland (cf. de Bernardo-Stempel 2007, 155), *h₁ék´u-i-dʰ-io-* (descriptive) 'horsey people', with **k´w* > **kʷ* > *p*, if the etymology is correct (cf. Isaac 2005, 193), cf. also the Gaelic name from the same area *MacEachairn* 'the son of the horseman'.

merchant activity in the western Mediterranean and east Atlantic (including the waters around Britain and Ireland) c.700 BC (cf. Strabo *Geog.* III, 5, 11, PNRB 90), Theo Vennemann (1999, 46), taken up in Coates (2009, 234, and 2012, 70–71), suggests a Proto-Semitic[11] provenance for the name, deriving it from the plural form of the generic '*y* 'island',[12] viz '*yym*, together with the specific to which two Proto-Semitic roots of the form **phd* 'lamb' and 'fright' belong. The development of initial /p/ to /b/ would be occasioned by the word being borrowed/taken over into Celtic, so Vennemann (ibid.), whereby /b/ would result from */m-p-/, as found in Ancient Greek, thus giving something like *e-bhd* + *a(i)* 'lamb/sheep island(s)'.[13] Given the frequency of the name 'sheep island(s)', also noted by Coates (ibid.), around or near the British Isles and Ireland, viz Färø (Faroe) Islands, Fair Isle, Soay (often), Lambay, Eilean nan Caorach (Durness, Sutherland), Sheppey (near London) etc., a name 'sheep islands' as a possible explanation for the Hebrides[14] would therefore not be out of place, though Coates (forthcoming) adds the caveat 'that the <b> needs to be accounted for within PSem., or by simple Greek sound-substitution of [b] for PSem. [p],' for the PSem. suggestion to be convincing.

→ ?'lamb/sheep islands'. Otherwise etymology unknown.

3a. DUMNA - Lewis

Pliny NH IV, 104 *Dumnam* (acc.), Ptol. II, 3, 31 Δοῦμνα* νῆσος {Dumna nēsos}, LG *Domon,*[15] PPR 20 *rí in Domnan*, 26 *do mhoigh domna*.

● Lewis (i.e. the Isle of Lewis and Harris). Watson (1926, 40–41), quoting Macbain, suggests the name may refer to the whole of the Long Island, i.e. the Outer Hebrides (the Butt of Lewis to Barra Head) (also PNRB 342).[16] Watson (ibid.) adds that the name turns up twice in an Early Modern Irish praise poem

[11] For an overview of a possible Hamito-Semitic language contact in the context of Britain and Ireland, see Willms 2013, 131–33.

[12] DNS 43 notes '*yl* 'Pun(ic), in the sense of peninsula only in connection with geographic names.' Some texts write only *y* (cf. Sauren 2005, 279).

[13] Though Coates (2012, 71) has reservations about the phonology here.

[14] The *r* in 'Hebrides', not to be seen in any of the early forms, would likely result from later scribal miscopying.

[15] LG: *Luid Matach* ⁊ *hErglan* ⁊ *Iartach, .i. tri maic Beóain co Domon* ⁊ *co hErdomon i tuascirt Alban* 'Matach and Erglan and Iartach, the three sons of Beóan, went to Domon and to Erdomon in the north of Scotland' (after Watson 1926, 40).

[16] The alternate (?later) name 'Lewis' may also have referred to the whole of the Long Island, though there is no evidence that 'Lewis' or 'Dumna' ever did.

to King Raghnall of Man (1187–1229),[17] viz PPR 20 *rí in Domnan* 'king of Domnan', PPR 26 (Ms. H) *do mhoigh domna* 'of the plain of Domon',[18] with retention of the genitive *Domhna*. These references would likely relate to Raghnall's overlordship of Lewis as part of the Kingdom of the Isles (cf. CMI s.v. Lewis f43r, f41v, f42v, f44v).

Cf. OIr *Domon/Doman* (CPNS 40) < *$d^{h}ub^{h}$-neh_2- 'deep'. The *-o/ā-* flexion as seen in Neo-British (Brittonic) sources is secondary. Originally *$d^{h}ubno$-, the nominal form, 'world' vs *$d^{h}ubni$-, the adjectival form, 'deep' (still seen in OIr *domun* 'world' vs *domain* 'deep') < *$d^{h}eub$- 'deep' (Isaac 2005, 192), cf. Gaul. *dubno-* (DLG 150–151 s.v. *dubnos, dumnos*).

→ 'the deep (i.e. far out, outer) island' (also PNRB 342).

3B. LEWIS

ON (H: MBS 28–29) *Ljóðhús*, CMI f34r *in insulam leodus*, f41v *insulam quandam que uocatur lodhus*, f42v *ad lodhus*, f44v *in insula que uocatur lodws*, MxB *Howas* (for *Lowas*?), Fordun II, 10 *Lewys*, MWIS §211 *Leozus* (*passim*), MM 1 *Lewis*, ScG *Leòdhas*.

● Uncertain. The Scandinvians, as noted by Richard Coates (1988a, 22), were 'past masters in the art of analogical reformation', e.g.

their *Ljódhús* (Lewis) as if 'song-house',
their *Í-vist* (Uist) as if 'inner-abode' (cf. Field 1980, s.n.),
their *Skið* (Skye) as if 'wooden hut',
their *Tyrvist* (Tiree) as if 'food-land' (from a folk-etymology of G *Tir-ithe* (OIr/MIr *ithe* 'act of eating' translated by *vist*)),
their *Íl* (Islay) (monosyllable) as if 'spring',
their *Orkneyjar* (Orkney Islands) as if 'seal islands' (ON *orkn* 'seal') instead of the expected **Ork-eyjar* (cf. Ptol. II, 3, 31 Ὀρκάδες {Orkades}).

That is to say, when the Scandinavians heard the various names, they almost certainly did not understand them, but adjusted them to known words or phrases in their own language. Scandinavian forms in this respect, therefore, cannot be regarded as genuine representations of earlier names. What *Ljóðhús* was originally meant to represent is not known.

→ etymology and provenance unknown.

[17] Cf. Ó Cuív 1957.

[18] Ó Cuív (1957, 291, 293) seems not to have understood the reference of the name Dumna to Lewis in the poem.

4. St KILDA – *Hirt*

As *Hirt*: ON (1202) *Hirtir*, RMS I 412 (1372) *Heryte*, RMS I 551 (1372) *Hyrte,* RMS I 520 (1373) *insula de Hert,* MxB *Alne islands*, Fordun (c. 1380) II, 10 *Insula Hirth*, MWIS (1549) §184 *Hirta*, CRA 145 (1567) *Hirtht* (cf. Taylor 1968, 139).

As *St Kilda*: *Skildar/Skilder* 1540, *S.Kylder* 1573, *S.Kilder*, *S.Kilda* 1578, 1592, *Skilda(r)* 1583, *Skildar*, *Skaldir* late 16th c., *S Kilder* 1603, *S. Kilda*, *Skilda*, *S Kilder* 1610, *St. Kilder*, *St. Kilda* 1698 (MM 280ff.), *S. Kilder* 1703 (Taylor 1969, 147, 153). ScG *Hirt* [hirʃtj] (Lewis) (Taylor 1969, 151).

● Watson (1926, 97–98) discusses the name briefly. He notes that the Gaelic form is *Hiort*, also *Hirt*, a genitive form used as nominative, and that a Norse saga has *Hirtir* to denote certain islands near (to the west of) the Hebrides. He adds that the name is identical with OIr *hirt*, *irt*, explained by Cormac as *bás* 'death', inviting the suggestion (quoted in Macbain, *Place-Names*, p. 177) that '[..] the ancient Celts fancied this sunset isle to be the gate to their earthly paradise, the Land-under-the-waves, over the brink of the western sea.' Watson (ibid.) also brings in the notion of St. Kilda being a saint's name, and that the form Kilda, according to Martin Martin (1703, 280), derives from 'the large well *Toubir-Kilda*'.[19] Watson (ibid.) notes this element (i.e. *hirt*) is also to be found in other Scottish place-names expressing the notion of 'death'.

However, the most detailed analysis of this name to date has been made by Alexander B. Taylor (1967, 1969). In dealing with the ON name *Hirt* Taylor comments:

> A review of the evidence shows that it is not and cannot be of Celtic origin [...]. The name can be traced back to 1202. In that year an Icelandic ship under Guðmundr Arason touched at an island on the west of the Outer Hebrides called *Hirtir*. *Hirtir* is the plural of ON *hjörtr* 'a stag'; and 'Stags', it is suggested, is a very suitable name for a seaman approaching the islands to give to their rugged outlines rising out of the sea [...]. [The name] first appears in Scottish sources in the fourteenth century as *Heryte, Hyrte, Hert* and *Hirth.* It is found Latinised in the sixteenth century as *Hirtha* and *Hirta*. (Taylor 1969, 151)

With regard to the name St Kilda itself, Taylor (1968, 1969) shows the

[19] This name is cited in Macaulay (1764, 101), quoted in Cox (2007, 21–22), as *Tober Childa Chalda*, comprising G *tobar* 'well', ON *kelda* 'well' and *kaldr* 'cold'. In a footnote Cox (2007, 22, fn. 16) refers to Taylor's (1968, 26) thesis regarding the provenance of the name St Kilda.

development of the name on successive maps, sea charts, sailing directions etc., from 1540 to 1698 (see above). In so doing he summarises his findings as follows:

> There is cartographic and other evidence that the place name *St. Kilda,* earlier *S.Kilda*, was originally applied in a Scots archtypal form **Skildar* or **Skilder* to an island or island group much nearer to the west coast of the Outer Hebrides.
>
> This archetypal form beginning *Sk-* makes it clear beyond doubt that the name was not originally a saint's name. It also invalidates a long-standing theory that the name is derived from ON *kelda* 'a well'.
>
> The archetypal form is probably derived from ON *skildir* 'shields'. There are in fact at least two groups of islands off the west coasts of Harris and North Uist which have the appearance of shields lying flat on the surface of the sea. [namely, *Gaskeir* (seen from West Loch Tarbert, Harris) and *Haskeir Eagach* (seen from the north-west shore of North Uist)].
>
> The name was first transferred further westwards to Hirta, in the form *S.Kilda* in a set of sailing directions and a chart in L. J. Wagenaer's *Thresoor der Zeevaert*, Leyden 1592. This is the first recorded occurrence of the name in the shape of a saint's name. Its form and its application appear to be the result of faulty copying of *Skilda(r)* in Nicolas de Nicolay's chart of Scotland, Paris 1583. (Taylor 1969, 153–54)

Finally, Taylor (ibid.) reiterates that the name *St. Kilda*, though now well established as a place-name, received its present form and connotation as a result of an orthographic error in the late 16th century.[20]

→ *Hirtir*: 'stags'; *Skildir*: 'shields' (both optical illusions).

5. UIST

ON (H: MBS 28–29) *Ívist*, Fordun II, 10 *Vyist*, MWIS §180 *Vyst* (*passim*), MM 42 *Uist*.

● Watson (1926, 37) mentions *Uist* but does not discuss the name. In an article on a possible meaning for Uist (a longish island in the Outer Hebrides comprising North Uist, Benbecula and South Uist), Richard Coates (1988a,

[20] Coates (1990, 55–59) discusses the name similar to the above discussion, but comes to no conclusion, noting only that the form '*Kilda* (or the like) never appears alone on maps, and that there are good late sixteenth-century map-forms of the type *Skild-*' (p. 58).

21–23, and 2012, 63–65) compares the name with that of the Balearic island of Ibiza in the western Mediterranean. Ibiza, Lat. *Ebussus* (Manilius and Pliny), Gr. Ἐβουσος (Diodorus Siculus), Ἐυσος (Strabo) *et sim.* He cites E. Hübner 1905, the commentator in Pauly-Wissowa, in the context of heavy Phoenician trading activity in the western Mediterranean during the second half of the first millennium BC, who suggests a possible Phoenician derivation of the name Ibiza, offering *'î-bûsim*, *'î-bôsem*, *'i-besim*,[21] with the meaning '(island) of some fragrant plant, e.g. balsam or pine', implying a lush vegetation.

In this regard Coates (ibid.) suggests a common origin for both the names Ibiza and Uist. In the latter case he proffers something like [iβis-]. The islands of both North and South Uist boast a lush green stretch of open field on their western side, the only extent of lush land in the whole of the Hebrides, with perhaps the exception of Islay, and in this respect is comparable with the island of Ibiza, also lush, but in pines (or perfumes). The intervocalic spirant, retained in the ON reflex *Ívist* and in the Balearic name *Ibiza* despirantised, is realised as something like [ü] in the Gaelic rendering of *Uist*, viz. [ü-is´t´] (native South Uist speech).

→ '?lush island'.[22] Otherwise etymology unknown.

6. SCITIS – Skye

Ptol. II, 3, 31 Σκιτὶς νῆσος {Skitis nēsos}, Ravenna (7th c.) 10915 *Scetis*, Adom. [I 33], II 26 *in Scia insula,* Adom. I 33 *in insula demoraretur Sci*, AT 668 *cum plebe Scith* (gen.), AU 668 *cum plebe Sceth* (gen.), AU 701 *imbairecc i Scii* (dat.) 'a fight in Skye', AU 1209 *cath for feraibh Sciadh* (gen.) 'a battle (won) over the men of Skye', BL (12th c.) *Scetha* (gen.), ON *a Skiþi* (H: MBS), *i Skið* (HákS),[23] CMI f42v *ad insulam ski*, f43r *ad ski*, MxB *Skey*, Fordun II, 10 *Sky*, MWIS §132 *Sky*, MM 131 *Skie*, Mercator (map) 1564 *Skye.* Watson (1926, 39) ScG *An t-Eilean Sgitheanach*, *an cuan Sgì* (sic)[24] 'the (narrow) sea of Skye' (the Minch between Skye and North Uist/Harris), cf. *Skið sund* (HákS.) 'the sound of Skye'.

[21] The Punic writing of the legends on Carthaginian coins for Ebusus, today Ibiza (published in DCH 2, 113–119, CNH 91–99), in transliteration is: *'y b š m* 'the island of perfumes' (cf. Sauren 2005, 280).

[22] Coates (2012, 64, fn. 10) observes that pine (*pinus sylvestris*) has been noted from the archaeobotanical record of peat bogs in South Uist, even though there is no longer any trace of this tree today in the Western Isles.

[23] Cf. also Taylor (1958, 53–56).

[24] Were *Sgìth* a noun, the article would not be expected, i.e. *Cuan Sgìth*.

● Isle of Skye. Possibly Celtic, as Isaac (2005, 208). If so, then possibly an *i*-stem < PIE *skĕi-d-, -t-* (*d*, *t*, *z*. T. 'präsensbildend'), cf. OInd. *chinátti*, themat. *chindati* 'schneidet ab, spaltet, splits', gr. σκίζω 'spalte, trenne,' Lat. *scindō*, *scidi*, *scisum* 'schlitzen, zerreißen, spalten', MB *squeigoff*, ModB *skeja* 'schneiden'; W *ysgwydd* (**skeid-*), C *scuid*, B *scoaz* 'Schulterblatt', OIr *scīath* 'Schulterblatt, Schwinge' etc., Goth. *skaidan* 'divide', OE *scide* 'a piece of wood', OIr *scian* 'knife', *sciath* 'wing' (also derived from the above root) (cf. IEW 920–21, cf. Taylor 1958, 52–56). Adomnán's form in *Scia* is likely a latinised rendering of the OIr form.

→ ?'the split, cut island', i.e. from its many inland-penetrating fjords (also Watson 1926, 38–39, PNRB 452). Otherwise etymology unknown.

7. EIGG

Adom. III 18 *in Egea insula*, Féilire of Oengus *Donnán Ega huare* 'Donnan of cold Eigg', AU 617 *Combustio Donnáin Ega*, AU 725 *Oan princeps Ego (moritur)*, AU 752 *Cummene nepos Becce religiosus Ego*, MxB *Ege*, MWIS §130 *Egge*, MM 276 *Egg*. ScG *Eige* [ek´ə] (CPNS 85).

● Eigg. As Anderson (2002, lxxii) notes, there would seem to have been two forms of the name. The Gaelic genitive *Ego*, *Ega* suggest an *i*-stem nom. *Eig*. Adomnán's form suggests nom. *Ege*, perhaps an *ia*-stem (GOI 186). Similarity between these two declensions led to some confusion at an early date. Watson (1926, 85) explains this name as of Gaelic provenance, equating it with Ir *eag* fem. gen. *eige*, dat. *eig* 'notch' (Di. 388), ScG *eag*, fem. gen. *eige* 'nick, notch, gap' (Dw. 379), 'with reference most probably to the marked depression that runs across the middle of the island from Kildonan to Bay of Laig' (ibid.). The ScG disyllabic pronunciation (above) probably reflects an oblique case form, as possibly also below.

Although the highland area of Eigg is divided by a glen cutting its way through the centre of the island, as sketched out above, the feature of Eigg that strikes one most to my mind is the long precipitous cliff on the eastern side facing Scotland, culminating in *An Cruachan* 'the wee stack', a head-like stack of rock at the southern end. Could the name of the island derive, rather than from Goidelic, from ON *Egg*, fem. gen. sg. and nom. pl. *eggjar* [ɛǧː], [ɛǧʲːaɻ̊] (IGTG 326 s.v. *egg* 2), Lat. *acies*, Eng. *edge* 'edge' (CV 116–17) relating to the cliff? Such a derivation would be quite fitting in the circumstrances.

→ '?gap island'; '?edge island'. Otherwise etymology unknown.

8. RUM

AU 677 *Beccan Ruimm*, AT 676 *Beccan Ruimean quievit in insola Britania*, Fordun II 10 *Rumme,* MWIS §126 *Rum*, MM *Rum.* ScG *Rùm*, gen. *Rùim* OT.

● Watson (1926, 95) reminds us that the adjective is *Rumach*, as found in *Cuilionn Rumach* 'the Coolin (i.e. mountain) of Rum, as distinguished from *Cuilionn Sgitheanach* 'the Coolin of Skye'; also *na h-Earadh Rumach* 'the Harris (mountainous district) of Rum', as distinguished from *na h-Earadh Ìleach* 'the Harris of Islay' and *na h-Earadh* (?*Leòdhasach* − my suggestion (GB)) 'the Harris of Lewis'? Otherwise he offers no solution to the name: 'may be pre-Celtic.'

Coates (2009, 237, and 2012, 80−81) offers PSem. **rām*, as in the modern place-name *Ramat Gan* in Israel and *Ramallah*, Palestine (PSem. root **rwm*).[25] He cautiously adds that he (in Coates 2006, 7−8) suggested this for Cornish Rame, apparently the name for a conspicuous conically-shaped hill on a headland in that parish overlooking Plymouth Sound. He notes that Rum 'is mountainous from every angle' (forthcoming) and boasts the highest mountain (Askival, 2664ft/812m) anywhere in the Western Isles, excepting the Cuilin of Skye.

However, Orel and Stolbova (1994, 450 s.v. 2120 **rim-*) (*pace* Coates) have [HS] **rim-* 'rise', Sem. **rūm* 'be high', Hebr. *rwm*. Based on **rVm*, WCh. **rim* 'stand (on hind legs)', HS *rīmī*. The Semitic reflex would readily give */ru:m/,[26] ScG /Ru:m, Rɔum/ OT, with later shortening of the vowel in the southern Hebrides?

→ ?'(island of) height, high island'. Otherwise etymology unknown.

9. ETH − Tiree

Adom. I 19 *Ethicam terram*, *Ethicam insulam* (acc.), *Aethici pilagi* (gen.), II 15 *ad Aethicam terram*, *ad Etheticam terram* (acc.), II 39 *in Ethica terra* (abl.), III 8 *ad Ethicam terram*, BB 205 a 11 *i tír iath seach Íle* 'to Tir-iath beyond Islay', Rawl. B 502, 115 a 5 *ort ocht turu Tíri iath* 'razed eight towers in Tiree', RD *Tirieth*, *Tiryad* 1343, *Teryed* 1354, *Tiriage* 1390, MxB *Chorhye*, Fordun II 10

[25] Coates (2012, 80, fn. 27) observes that the root is given as **rVyVm* in Militarev (2007, entry 1179), though Hebr. has alternating /w/ for the second syllable.

[26] In Phoenician-Punic, *r* is an alveolar median resonant /r/, which may be geminated, as seen in the Greek and Latin transcriptions of the Pi'el active particple *M'RḪ me'rreḥ* as **Μηρρη** and **Merre** respectively, with gemination of /r/ (Krahmalkov 2001, 25).

Tyree, *Tyriage* 1494, *Tiereig* 1496 (CPNS 86), MWIS §118 *Thiridh*, MM 267 *Tir-iy.* ON (H: MBS) *Tyrvist*, ScG *Tiriodh* ['t´^{h}ir´əɣ] ?> [t´^{h}ir´i:] OT (cf. also Watson 1926, 86).

● Watson (ibid.) notes that Adomnán's *eth* became OIr *iath*, reflecting the Early Celtic long *ē* (< IE *ei*) in Adomnán which had been broken to *ia* by 800, thus the saint's name *Cēran* became *Ciaran.*[27]

In addition, MIr/EModIr original neutral *dh* /ð/ became /ɣ/ and palatalised *dh* /ð´/ became /j/ around 1200, thus falling entirely together with original *gh* (Jackson 1955, 87). This might perhaps be seen in the various spellings (above), earlier with *-th* but later with *-d*, *-g* (representing /-ɣ/), finally /-ɣ/ disappearing altogether in the name, except apparently in Tiree itself, viz ['t´^{h}ir´əɣ] (with strong initial stress), but seemingly lost outside Tiree, viz [t´^{h}ir´i:] OT (cf. also Watson 1926, 86). The second element *-ēt(h)* does not seem to represent any known Gaelic or Celtic root.[28]

→ 'land' + unknown second element.

10. COLL

Adom. I 41 *de insula Coloso*, II 22 *inter Maleam et Colosum/colosam insula*, MxB *Cole*, Fordun II 10 *Coel*, MWIS §120 *Coll*, MM 271 *Coll*. ScG *Cola* [k^{h}ɔLə] OT.

● The presence of an intervocalic /s/ in the name is a problem, as noticed by Watson (1926, 84) and Coates (2009, 236, and forthcoming). Watson (ibid.) reminds us that Celtic intervocalic /s/ had long disappeared before Adomnán's time, and medial and final /s/ in OIr represents older groups, e.g. *cos* 'leg, foot' < **coxa*, and accordingly suggests that Colosus may be pre-Celtic.

Coates (ibid.) accepts the dangers of identifying this form naively with Greek *kolossós* (of uncertain origin), especially if we associate it with a standing stone in Coll seemingly of the vintage of those in Lewis and North Uist. Though Coll is traditionally explained as deriving from Gaelic *coll* 'hazel', as noted by Coates (ibid., 237, and 2012, 77), it is difficult to reconcile the present form of the name with that in Adomnán.

→ Of uncertain origin.

[27] Though not in Manx, which retained *Cēran* (written *Kerron* but pronounced [kɛ:rən]) (GB).

[28] It cannot be OIr *ith*, gen. *etho* 'corn' < ?PIE **et(e)n* 'Kern, Korn'? (IEW 343) (even though Tiree is reputedly rich in barley), as the diphthong *ia-* (not the single vowel *i-*) is a development from Early Celtic long *ē,* as noted above (cf. Watson 1926, 86).

11. MALAIOS – Mull

Ptol. II, 2, 11 Μαλεός, Μαλαῖος {Maleós, Malaios}, Ravenna 10529 *Malaca* (assimilation, as Isaac 2005, 197), Adom. I 22, I 41, II 22 *in Maleam insulam* (acc.), ON (H: MBS) *Þjóð mylsk* 'people of Mull', MxB *Muley*, Fordun II, 10 *Mule*, MWIS §100 *Mule*, MM 250 *Isle of Mull*. ScG *Muile*, *An t-Eilean Muileach* 'the Mull island' OT.

● Isle of Mull. Watson (1926, 38) notes that the suffix *-aios* becomes *-e* in Goidelic and that Adomnán's *Malea* is an adjective fem. from *Maile*, which would regularly appear in Adomnán's time. He suggests for the first element *mal-*, ScG *mol-adh*, W *mawl* 'praise', cf. OCS *iz-moleti* 'eminere', 'to stand prominent' in the sense of 'lofty', i.e 'lofty isle'.

De Bernardo-Stempel (2007, 153) suggests 'the evil one' < **mḷ-yo-s*, possibly related to OIr *maile* 'evil' (ibid., 2000, 105), with reference to ibid. (1987, 127), but without discussion.

In view of the foregoing, Coates (2009, 234, and 2012, 68–69) offers PSem. **mlh* 'salt', cf. Hebr. *mallûaħ* 'a salt marsh plant (?marsh-mallow)'. Given that Mull is not known archaeologically for salt production, it seemingly does have salt-marshes, albeit small ones. Coates (ibid.) notes that the presence of salt-marshes in the Hebrides is not unusual.[29]

More likely, however, the name derives from PCelt. **malo-* 'rising, prominent' (cf. MIr *mell* < **mel-no-, mull* 'ball, clump'). To PIE **melh$_3$-* 'hervorkommen' LIV 433–34, IEW 721 s.v. **mel-, melə-, mlō-* 'rise up, rising land', Alb. *mal* 'mountain'.

→ 'rising-up, mountainous land' (as DCCPN 24, Isaac 2005, 197), 'A sense "hill(-island)" seems appropriate [...] whatever the ultimate origin of **mala, *mel-*' (PNRB 409). Mull is quite mountainous.

12. HY – Iona

Fél. May 25 *Dunchad Híae húare,* AU I 356.13 *Indrechtach abb Iae,* TFrag. 20.12 *do muintir Iae,* BCC 200.4 *an t-oilen darub ainm hÍ Colaim Cill* (DIL I s.v. Í 1(II), 9), Adom. I 29 *in Ioua insula*, II 27 *in campulo occidentali Iouae insulae*, II 45 *ad Iouam insulam,* CMI f40r *ad insulam que uocatur hy*, f44v *in Iona*[30] *insula*, Fordun II, 10 *Hy Columbkille*, MWIS §103 ... *lyis ane Ile callit*

[29] Coates (forthcoming) brings in a suggestion from Orel and Stolbova (1994) of the reconstructed PSem. root **malaw* 'desert' as a possible solution for Mull but is not convinced of its suitability in the context.

[30] The form here *Iona*, with clear *n* not *u*, appears in a section of f44v added by Scribe 2, c. 1274 (cf. Broderick 1995, ix).

in Irish leid Icholum chille, that is to say in English Saint Colms Ile, … this Ile of Colmkill, MM *Iona*. G *Ì*, *Ì Chaluim Chille*, *Eilean Ì* (Dwelly 1016).

● The origin of the name *Iona* (a seemingly scribal misreading for *Ioua* in a text ultimately derived from Adomnán), OIr nom. *hÍ/Ia,* acc. *hÍ*, gen. *Hiae*, *Ia*, dat. *in Hi*, *in hÍ* (DIL I s.v. Í 1(II), 9) is unknown. Adomnán's *Ioua* is an adjective formed from the name of the island. Watson (1926, 87–89) expresses some uncertainty about its origin, but tentatively suggests (p. 88) that *Ioua* 'seems to go back [...] to a derivative *Iuoua*, 'which might mean "Yew Place", with which we may compare the Gaulish [deity] *Ivavos* [...],' though yew trees are seemingly unknown in Iona.

Again, in the context of the presence of Phoenician traders in the area of Britain and Ireland during the earlier part of the first millennium BC (c. 700, if not earlier), the Gaelic form *Í/hÍ* may derive from the Proto-Semitic word *'(a)y-* 'island, isolated place' (cf. Sauren 2005, 279), with the foregoing meaning or the sense 'island of a special sort, a holy place'.[31]

Old Irish *Í*, according to DIL I: Í 1(II), 9, is derived from ON *ey* 'island' and is the ON name for Iona. However, ON would seem to me to be too late to provide such a derivation, as it implies that the island had another name before the Vikings arrived. Anderson quotes the tradition that

> [s]oon after his arrival in Britain Columba stayed (*conversatus*) with the overking of the Dál Riata, Conall son of Comgall (i. 7). A tradition that Conall gave the island of Iona to Columba was mentioned in the Ulster Chronicle (AU s.a. 573), so it is not later than the early tenth century, but the form *Columbe cill(e)* suggests that the entry was not made much before 750. Bede, probably relying on a Pictish source, said that Iona was given to Columba by the Picts. There could have been truth in both traditions, though Bede's account is difficult to accept as it stands. Adomnán and Bede both write of Columba's coming to Britain; neither actually mentions his arrival in the island [?of Iona]. (Anderson 2002, xxxi)

According to Seán Duffy (AIH 24), the first recorded Viking attack on Ireland took place in 795. By the mid-ninth century the Vikings had set up permanent bases in various parts of Ireland, in and around Dublin (in 841),

[31] In discussing this same topic Coates (2009, 233) also suggests a PSem. solution, and asks whether 'the form *Ioua* contains more than *Í* does'? But he has seemingly taken *Ioua* to be a form of the name *Í*, whereas, as we have seen, it is in fact an adjectival form as used by Adomnán (see above).

around Limerick, Cork, Waterford and Wexford (AIH 25 map). This would suggest that ON *ey* for Iona entered Old Irish as *Í* during the early years of the ninth century, if not before. Nevertheless, its arrival in Old Irish in the context of Columba would seem to be late.

However, if OIr *Í* derives from PSem. *'(a)y-*, a form of long standing (as with other possible PSem.-derived place-names in the area of Britain and Ireland) used by Phoenician traders that would filter down to others as and when necessary, with the form *Í/Hí* referring to Iona as a remote island possibly of some religious significance (as such isolated places tended to be, even today[32]), then the reputation of Iona as a holy place will have existed long before the time of Columba. In which case, it is suggested, Iona did not achieve the aforesaid reputation because of Columba, rather Columba was sent thither precisely because of the long-standing reputation that Iona already had.[33]

→ ?'island, remote place (or of some religious significance)'. Otherwise etymology unknown.

13. ILE – Islay

Adom. II 23 *in Ilea insula*, var. *ilia*, OIr *Íle* (gen.) LBr. 14, *Iligh* (dat.) LBr. 23, DIL I. 63 s.v. *Ílech*, AU 739 *Ila*, *Ile*, *Ili* (dat.), ON (H: MBS) *Íl*, CMI f33v *in insula que uocatur yle*, RD 251 (c. 1173) *Hyle*, LSP 1297 *Yle*,[34] MxB *Ile*, Fordun II, 10 *Ile*, MWIS §70 *Ila*, MM 231 *Ila.* ScG *Ìle* [i:lə] OT.

● Isle of Islay. Watson (1926, 86–87) suggests a Celtic provenance, comparing the name with the Gaul. PN *Ilio-māros* 'big-flanked, big-buttocked', < ?PIE *īli-* 'Weichen, Eingeweide, Geschlechts-teile'?, gr. ἴλια, lat. *īlium, -a* 'flank', ob hierher cymr. *il* 'Gärung, (*Schwellung?)', gall. PN *Ilio-māros* 'mit großen Weichen' und die schott[ische] Insel air. *Íle*, engl. *Islay* (Watson, *Celtic Place-Names*, 87)? Vielleicht hierher slav. **jelito* (aus **jilito*?) usw. 'Weichen, Darm, Hoden', in wruss. *jal'ity* 'Hoden', poln. *jelito* 'Darm', dial. 'Wurst', usw. (IEW 499). As with *Scia* and *Ioua*, Adomnán's *Ilea* is likely an adjective formed from the name of the island.

→ ?'flank-like island, island of flanks' (from its shape, though this is only

[32] E.g. Skeilig Mhíchíl, Inis Bó Finne, Lindisfarne, Mont St Michel (St Malo), St Michael's Mount (Cornwall) etc.

[33] Coates (2012, 66) reaches a similar conclusion.

[34] Cf. also Taylor (1958, 56–57).

noticeable with a bit of fantasy, if one stands at the head of Loch Indaal; otherwise not).[35]

However, given the European proclivity for regarding islands in the west as sacred, bearing in mind in this context the western-most position of Islay in its sector of the Inner Hebrides and with regard to Phoenician mercantile involvement, Coates (2009, 233–34, and forthcoming) suggests PSem. **ħll* 'pure, holy', cf. Phoenician *'l*, 'with the second syllable in the modern name attributable to an extended form of the root comparable to those seen in Hebrew *'Eloah*, Biblical Aramaic *'Ĕlāhā* and Arabic *Aḷḷāh* (< PSem. **al-'ilāh*) "the god, God" [...]' with generic **'y* 'island, remote place', viz *'y'lāh* 'island of the god'. In Phoenician, *l* was an alveolar lateral resonant, viz /l/, as in *'allōnīm* 'gods' (*'LNM*) (Krahmalkov 2001, 23), similar to the lenis alveolar *l* in G *Ìle* /i:lə/. As a possible extension of this meaning, given Islay's greenness and lushness, perhaps 'God's island' in the sense of 'lush island'?

→ ?'island of the god' (sense 'holy island') or ?'the god's island' (sense 'lush island'). Or the first element *Í-* may contain the PSem. *'(a)y* 'island, remote place' (see under *Hy* (Iona), above) + an unknown specific. Otherwise etymology unknown.

14. HINBA – Colonsay/Oronsay or Jura?

Adom. I 21 *ad Hinbinam insulam*, I 45, II 24, III 5, III 17–18 *in Hinba insula*, III 23 *Hinba in insula*.

● According to tradition, it was in Hinba that Columba allegedly founded a monastery at a place called *Muirbolc Már* 'great seabag/bay'. As Watson notes,

> it was not very far from Iona, for Columba often visited it. It appears to have lain in the track of vessels coming from Ireland, at least that seems to be the inference from the fact that Comgell, Cainnech, Brendan, and Cormac, coming from Ireland to visit Columba, found him in Hinba. (Watson 1926, 82)

The identity of Hinba is therefore dependent on the whereabouts of the

[35] Taylor (1958, 57) notices that the name appears in a number of river names in Britain, e.g. River *Isle* (with the towns *Il*ford, *Il*chester, *Il*minster (my italics) in Somerset, England), River *Ilidh/Ullidh* (Sutherland, Scotland), River *Isla* (Angus, Scotland), but offers no solution. Here Isaac (2005, 193) does not regard the element *Íla* in the river name *Íla potamoû ekbolai* (Helmsdale) as obviously Celtic or IE, but speculatively compares it with OIr *ilach* 'howling, ululation'(?), suggesting an onomatopoeic name for the river name, 'the howling river'? This would seemingly not apply to the island name, however.

aforesaid *Muirbolc Már*. As Hinba clearly lies on the way from Ireland to Iona, two possibilities come into focus, namely Colonsay (with Oronsay) and Jura. Watson notes:

> The choice seems to lie between Colonsay and Jura. At the south end of Colonsay is Oronsay, separated by a channel fordable at low water, and with extensive remains of a medieval priory [...]. The channel between Colonsay and Oronsay widens into a broad bay, with a bag-like horn on the north side about half a mile wide at the mouth. The island of Jura is almost bisected by the deep inlet on its western side, known as Loch Tarbert. At some distance from its mouth the loch contracts, and then widens, thus forming an ideal *bolc* or bag [...]. (Watson 1926, 82–83)

In a recent survey of Hebridean island names found in Adomnán's *Vita Sancti Columbae*, Kelly Kilpatrick (2013, 2–4) discusses the identity of Hinba on the basis of the whereabouts of *Muirbolc Már*. She notes

> *Hinba* (KP's italics, and elsewhere) is the second most widely attested island-name [in Adomnán]. After extensive research, I have concluded that *Hinba* is likely to be identified with Colonsay, and perhaps both Colonsay and Oronsay. The place-name *Muirbolc már* 'great seabag' is comparable with other *muirbolc* places (e.g. Kentra Bay, Adomnàn's *muirbolc paradise*, and Murlough Bay, Co. Down, both characterised as being nearly empty of water when the tide is out, exposing sands). *Muirbolc már* should be identified with The Strand [between Colonsay and Oronsay]. (Ibid., 3)

At first sight Kilpatrick's argument sounds convincing and the possibility of The Strand being Columba's *Muirbolc Már* cannot be ruled out. However, if we come to look at the name Hinba itself and analyse it – as Watson (1926, 84) suggests – as a latinised form[36] of OIr *inbe* 'notch, incision' (cf. DIL I 204 s.v. *inbe* 2), then *inbe* (assuming that this interpretation is correct) is unlikely to refer to a wide strand, but more likely to a deeply-penetrating inlet of the sort exemplified by Loch Tarbert in Jura? As we have seen, Jura also lies on the route between Ireland and Iona.

→ ?'incision island, island of the incision'. Jura? Otherwise etymology unknown.

[36] Initial *H* was probably silent (Anderson 2002, lxiii).

15. ARRAN

OIr nom. *Ara*, *Arand*, *Arann na n-aighedh n-imdha* 'Arran of the many stags', gen. *Arann*, *loingsech Ile ocus Arann*, dat. *Araind* (Watson 1926, 96), MxB *Aran*, Fordun II, 10 *Arane*, MWIS §3 *Aran,* MM 217 *Arran.* ON (HákS 322) *til hereyeia* (var. *við hereyar*), (ibid. 326) *hers-ey*,[37] Ir *Árainn Mhór* OT, ScG *Arainn* [ɛrin´] (Holmer 1957, 6).[38]

● Watson (1926, 97) regards the meaning of Arran (with short initial *a*) as 'unknown, and the name may be pre-Celtic', but views (ibid., 87) Ir *Árainn* (with long initial *a*) as deriving from OIr *áru* 'kidney', from its shape.[39] He also notes, but without comment, that there are several Welsh names which appear similar: *Afon Aran* (Radnorshire), *Aran Mawdd*[*w*]*y* and *Aran Benllyn* (hills near Bala); *Arenig Fach/Fawr* (hills NW of Bala).

Deirdre and Laurence Flanagan (2002, 17) suggest that Ir *Árainn* (with long initial *a*) 'is a word construed as meaning 'ridge' and is virtually confined to Aranmore, Co. Donegal, *Árainn Mhór* "large ridge", and the Aran Islands, Co. Galway, *Árainn* + "Islands", "ridge (islands)"', presumably from their shape as seen from a distance, though without any discussion. In this same vein, but with some discussion, Owen and Morgan (2007, 17–18) regard the two examples of *Aran* that they cite, viz *Aran Benllyn* and *Aran Fawddwy* (cf. Watson, above), as 'ridge' names < *âr* + dim. suffix *-an*; so also the two diminutive forms, *Arenig Fach/Fawr*, as well as the related 'ridges' of the collective variant *Eryri* (ibid. 443).

In this context see also PCelt. **ar-*, *ara-*, *aro-* 'moving, rising, raised' with

[37] As noted by Nicolaisen (1992, 3), the ON name for Arran, *Hersey*, 'is only recorded in connection with the movements of Hákon Hákonsson's fleet in 1263. It is therefore difficult to judge how widely the island was known by the Norsemen and for how long they used a name of their own for it.' However, given that there are seemingly similar names in Norway (e.g. *Hereyar, Herøane*, as supplied to Nicolaisen by Hermann Pálsson), the Arran variant may owe its existence to the Norwegian island names.

[38] Note also a form with [a]: [dɔɬ ə ɣarin´] 'going to Arran', [bɔn´i mi də ɣɛrin´] 'I belong to Arran' (Holmer 1957, 47).

[39] In this regard Ian Fraser makes the following pertinent remarks: 'The fact that Arran is roughly kidney-shaped is not in dispute, but to suggest that those who coined the name were aware of the nature of the physical outline of the island is stretching credibility to the limit. There is absolutely no reason to believe that Dark-Age man looked at Arran as an entity in the shape of a kidney. Nevertheless, islands and island groups, viewed from the sea can present characteristic shapes and outlines, to the extent that sailors approaching from a distance may well have been influenced by such impressions when selecting a name. This is true also of mountains, since many peaks are named because of the shape or outline which they exhibit, and not from any characteristic which may be obvious when one views the land from their summits.' (Fraser 1999, 11)

o-grade root cognates in OIr *or* masc. *o*-stem 'border, limit', MW *or* masc. 'border, edge'; Av. *ar-* 'get moving', Gr. {oros} 'mountain', Hitt. {ara:i} 'gets up'. PIE root: formation originally preconsonantal zero-grade PIE $*h_3r$- < $*h_3er$- 'get moving' (IEW 326–32, LIV 266–67). The meaning 'border' of the Neo-Celtic reflexes probably derives from the frequent appearance of mountains and ridges as political and ethnic boundaries (cf. PNPG/CE s.v. *ar-*, *ara-*, *aro-*). The Irish, Scottish and Welsh forms in *a-* would predate the *o*-grade forms of Neo-Celtic.

→ ?'ridge (island)'. This meaning in my view, from what I have seen either in real life or from photographs, could apply (*pace* Coates 2009, 232, and 2012, 62) to all examples of *Aran* (variously spelt) in Ireland, Scotland and Wales. All the same, a pre-Celtic origin of the name, as Watson (1926, 97) and Coates (forthcoming) suggest, cannot be ruled out.

16. BUTE

Ravenna *Botis*, Paisley Reg. (1198 × 1204) *insula de Bote*, Paisley Reg. (1241 × 1249) *de Buyt*, Icel. Sagas (c. 1260) *inn til Bótar*, *til Bótar*, *Bót*, MxB *Bothe*, Fordun II 10 *Bothe*, RMS 1392 *apud Bute*, MWIS §6 *Buit*, MM 214 *Boot*. Current OS maps *Bute* (cf. Márkus 2012, 125–27), ScG *Bód* [bo:ɒ], [bɔ:ɒ] (Holmer 1957, 55).

● Rivet and Smith (PNRB 273) suggest that the name may be derived from a root which gives W *bod*, Ir *both* 'dwelling', here in an apparent plural form, though this may be deceptive: we could assume here **Bot īs* (for *insula*), misread or misunderstood by earlier map-makers as a plural form.

However, Gilbert Márkus (2012, 129–30), given that W *bod* [bo:d] can mean 'dwelling' (~ PBr. **bot-*) and has a long *o*, as does the modern Gaelic name for the island, urges that we perhaps look to North British or Pictish, i.e. *p*-Celtic, as a possible provenance of the name. Márkus cites John of Fordun's *Chronica Gentis Scottorum* (ch. 28) as possibly coming quite near to a solution:

> *sanctus Brandanus in ea botham idiomate nostro bothe .i. cellam construxit. Unde et deinceps et usque tempus nostrum habetur binomina quod aliquando Rothisay .i. insula Rothay, sic et aliquando insula de Bothe ab indigenis nuncupatur.* (Fordun, 28)
>
> 'Saint Brendan built a church there, in our language *both*, that is a cell; therefore from then on up to our own time it is known to the natives by two names, sometimes Rothesay, i.e. island of Rothay, and sometimes the island of Bute.' (After Broun 1999, 55–56)

In addition, Márkus (ibid.) notes that W *bod* can also mean 'church, chapel', and, given the presence there of the church of Kingarth, a church of some apparent significance in times gone by suggests that Bute may take its name from North British **bot*. However, taking his cue from Watson (1926, 97), Márkus (ibid., 130) does not rule out the possibility of a pre-Celtic origin of the name, as he notes to be the case seemingly with other Hebridean island names:

> Finally, it is worth considering the possibility that the name Bute was not coined in any Celtic language, but that it is pre-Celtic and therefore that its origin and meaning are lost to us. This would align the name with several other islands off the west coast of Scotland whose names do not seem to contain elements drawn from Celtic languages [...]. (Márkus 2012, 130)

However, Coates (2012, 81) observes that Neo-British **bod* 'dwelling' (W *bod*, C *bos*; PBr. **bot-*) can be compared directly with PSem. **but* 'hut' (Orel and Stolbova s.v.),[40] though his suggestion of 'dwelling(s) island', inferring 'an entire territory marked by a difference of status expressed in building technology, or simply naming from a, or the, prominent settlement', is formally possible, but unlikely.[41]

→ ?'church island, island of the (renowned) church; ?dwelling(s)/hut(s) island'. Or of unknown etymology.

Conclusion

As can be seen above, many of the island names seem insolvable, suggesting that they were coined very early on, some perhaps by the earliest settlers after the Ice Age. We do not know what languages the people spoke who may have

[40] Oliver Padel (1985, 25), quoted by Coates (2012, 81), notes that the British word denoted or connoted a dwelling-place of humbler status than **treβ-*, the usual word for 'farm' or 'village' in the Neo-British languages.

[41] Nevertheless, such allusions are made, even by earlier peoples. The name *Great Orm* for the headland adjacent to Llandudno in North Wales, for instance, was apparently given by Scandinavian sailors, as the headland concerned looked like a serpent (o*rmr*) coming out into the sea (Gillian Fellows-Jensen, personal communication 1999). In addition, a west coast triad runs thus: *a' Chearc Leòdhasach, an Coileach Arannach agus an Eireag Mhanannach* ('the Hen of Lewis, the Cock of Arran and the Pullet of Man (i.e. the Calf)') – to see these three in one day was reckoned good sailing, i.e. too good to be true (Watson 1926, 96–97). Note that all these are place-names given by Gaelic speakers to landmarks from their shape.

coined some of these names. All we know for certain is that the languages that generally shaped the nomenclature of Britain and Ireland, as we saw at the beginning, are Indo-European. There are, however, as Wilhelm Nicolaisen (1992, 2) also noticed, a number of names which we seemingly cannot ascribe to any language we know of. These include some of the major island names in the west and north, viz *Islay*, *Tiree*, *Rum*, *Uist*, *Lewis*, *Unst*, *Yell*, as well as the name of the *Hebrides* itself. There was evidently no shared tradition regarding the name *Hebrides*, for instance, since various peoples had their own names for them: the Gaels: *Innse Gall* 'the islands of strangers', the Norse: *Sudr-eyjar* 'southern isles', the English: *Western Isles*. In terms of re-interpreting some of the island names, Nicolaisen had this to say:

> Attempts have been made to re-interpret several of the individual island names through what is called 'folk-etymology' in terms of Gaelic, and the Norse had a go at Lewis calling it *Ljódhús* ['song-house']. *Islay*, for example has been said to be related to the element *Ilio-* in the Gaulish man's name *Ilio-mārus* meaning 'flank' or 'buttock'. *Tiree* is etymologised as *Tiriath* 'corn-land', *Mull* has been connected with Gaelic *mol-adh* 'praise' and *muileach* 'dear, beloved' in the sense of 'Lofty Isle' (in Ptolemy it is *Malaios*), and *Skye* has had two alternative explanations imposed upon it, depending on whether we link it more closely with Gaelic *sgian* 'knife' or *sgiath* 'wing'; if the former, then a meaning 'Divided Isle' seems to be a possibility, if the latter 'Winged Isle' is to be preferred. One can observe recrudescences of such thinking at all times, and there have been various suggestions for the name *Arran* in the same vein. The one most frequently quoted is Early Gaelic *aru* 'kidney', offered like the etymologies for *Skye* and *Islay* because of the shape of the island. If, in fact, *Skye* is indeed wing-shaped, if *Islay* looks like a behind and *Arran* like an over-sized kidney, the potential perception of such similarities in outline is more likely to belong to a later age when maps and charts had become available, or to an even later period when one could see the shape of the islands from above; circumnavigating an island and viewing it from the sea are less likely to suggest toponymic metaphors even if there are homophones in the vocabulary which might trigger such speculation.[43] In my view we are on safer ground when we think of *Arran* and the other island names as pre-Celtic and also as pre-Indo-European, a solution − if it solves anything - that leaves us with the thought that practically all the major islands in the Northern and Western Isles have very old names, so old and so linguistically and lexically opaque that we do not have any plausible referents for them elsewhere. They are linguistic fossils, perhaps some three thousand years old or even older. (Nicolaisen 1992, 2).

Until recently solutions to the meaning of the names of the various major Hebridean islands have been looked for within a Celtic context, and this has in a number of cases led into a cul-de-sac, resulting often in a frustrating admission that the names might be 'pre-Celtic'. In recent years, in the context of Phoenician mercantile activity around Britain and Ireland during the early first millennium BC, a possible Proto-Semitic solution in a number of cases has been sought. Given this situation, the present article seeks to loosen the log-jam to some extent in offering a few suggestions. But for many names it is likely that we may never get to know their provenance or meaning at all.

REPRESENTATIVE GOVERNMENT AMONG THE HEBREWS AND PHOENICIANS

A Contribution to the Problem of the עם הארץ raised by Judge Mayer Sulzberger

In his instructive study entitled *The Am Haarez, the ancient Hebrew Parliament*, Judge Mayer Sulzberger, with the competence of an eminent legal authority manifested in every line, endeavours to determine anew the constitutional government of ancient Israel. After arguing his thesis with sagacity, the learned Judge reaches a conclusion revealing a new aspect of prime importance which must impress itself on the Jewish historian: Hebrew antiquity knew of constitutional, representative government. This régime which can be traced to the time of the Judges definitely appears in the age of Samuel, when we come across the chosen of the people, ראשי הקרואים, cp. קרואי עם. This term reappears in many biblical passages which have been misunderstood by historians ignorant of Oriental antiquity, and which treat of the assemblies of the Israelites under the name of ראשי עם הארץ or even עם הארץ, their active rôle being determined by a whole series of political changes in Israel.

The thesis so wisely developed deserves attention. However, such is often the force of historical routine in many erudite circles that they fear every opinion—however true it may be—just on account of its originality. The only way to react against such a routine is to accumulate evidence tending to make truth triumph. May I therefore be permitted to offer my moderate contribution to the elucidation of such an inspiring problem?

To show how one must not isolate pre-exilic Israel from the

multitude of his Hebrew or Hebrew-Phoenician neighbours, I shall try to recapitulate all that is known to-day concerning the ancient constitution of Phoenicia, the analogy of which to that of Israel has already been discussed by me.[1]

It is chiefly the Phoenician and Punic inscriptions substantiated by the testimony of the ancients which will furnish us new data concerning the constitutional régime of these peoples. Let us begin by saying that after having experienced—together with the people of Israel—a prehistoric period of the rule of suffetes, שופטים, and representatives of the people, the Phoenicians of Tyre and Zidon wound up by adopting the same political system as Israel: the first known independent Kings of Tyre, Abiba'al and Hiram, are contemporaries of David and Solomon. Only, and this despite the dearth of historical documents, all that we know of the history of Tyre points to a chronic conflict which existed between a popular party, the plebeians, and the royal party or aristocracy. The reactions and revolutions among them are numerous.[2]

Indeed, it is as a reaction against the tyranny of the royal régime at Tyre that the founders of Carthage, having expatriated themselves in order to go to Africa, decided to adopt a republican system of government with two suffetes or judges (magistrates) at the head. In a general way the Phoenician inscriptions know two political régimes different from one another: (1) The monocratic régime which is characterized by the mention of an era dated from the coronation of the מלך or sovereign. (2) The republican régime which is characterized by a demotic era, i. e. which counts the years from the foundation of the new republican form of government or else from the eponymous year, i. e. the year which bears the names of the suffetes who were then in power.

To the last category belong the documents which come from the Seleucid era, wherein the Phoenician cities constituting

[1] See *Les Hébréo-Phéniciens*, Paris, 1909. Also *La Civilisation hébraïque et phénicienne de Carthage*, Tunis, 1912.

[2] See the famous passage of Menander cited by Josephus, &c.

a republic still found themselves dominated by the Syrian kings and subject to their suzerainty.

As a specimen of the first category may serve the great inscription of Zidon dated at the period of Persian domination and published in the *Corpus Inscriptionum Semiticarum*, I, No. 2. The following is the text of the first line which is of interest to us:

בשנת עסר וארבע למלכי מלך אשמנעזר מלך צדנם

'In the year XIV of my reign (I) Eshmunazar, King of the Zidonians.'

Here it is the king who dominates the era: none else is mentioned. The people do not participate in the management of the government.

The same is true of the Phoenician colonies of Cyprus where the royal régime predominated, as may be seen from the Assyrian inscriptions of Sargon.[3]

The *CIS.*, I, Nos. 88 and 89, offers us a similar formula for a Cyprian king of the Ptolemaean age. The first line reads:

בשנת שלשם למלך מלכיתן מלך כתי ואדיל

'In the year XXX of my reign (I) Melechyaton, King of Kiti (Kition) and of Adel.'

As to Tyre, we lack for the present inscriptions relative to the régime which would characterize her royal period contemporaneous with the kings of Israel. But we know that during the Greek supremacy, when the republican régime was definitely established in the city of Tyre, it was the δῆμος, the עם, which signalized its advancement to power through the establishment of an era appropriate to it. This point is so important to our thesis that I venture to reproduce the inscription of *CIS.*, No. 7, *in extenso*, with its Latin translation according to the editors of the Corpus[4]:

[3] See Maspero, *Histoire ancienne des peuples de l'Orient*, p. 500.

[4] It goes without saying that the Phœnician orthography differs from the Hebrew.

לאדן לבעל שמם. אש נדר
עבדאלם בן מתן בן עבדאלם בן
בעלשמר בפלג לאדך. אית השער
ז״ והדלהת אש ל פעלת בתכלתי
בנת בשת CL XXX לאדן מלכם.
CXLIII° שת לעם צר לכן לי
לסכר ושם נעם תחת פעמי אדני
בעלשמם לעלם. יברכן.

Domino Baali coelorum votum quod vovit Abdelimus, filius Mattanis, filii Abdelimi, filii Baalšamari, in [circulo] Laadic[ae]. Portam hanc et valvas eius feci in exsecutionem illius (voti). Aedificavi eum anno CL XXX domini regum, CXLIII° anno populi Tyri, ut sit mihi in memoriam et nomen bonum sub pedibus domini mei Baalis coelorum in aeternum. Benedicat mihi.

To facilitate the reading I offer a Hebrew translation or rather an orthographic reproduction:

לאדון לבעל שמים[5] אשר נדר עבדאלים
בן מתן בן עבדאלים בן בעלשמר
בפלך לודביא.[6] את השער הזה והדלתות
אשר לו פעלתי בתכלתי[7] בניתי בשנת 180
30 לאדון מלכים. 143 שנה לעם
צור להיותם לי לזכר ושם נעים
תחת פעמי[8] אדוני בעל שמים
לעולם. יברכני.

In this inscription we find three dates: the first is not certain; the second is that of the reign of a Seleucid king; the third is that of the establishment of the Republic of Tyre which, according

[5] The god of heaven, בעל שמים, is the pure Semitic deity, in contradistinction from בעל חמן = בעל שמש who is the solar god. (See my study cited above.)

[6] Or לודקיא according to the Talmud.

[7] From בלה ונחרצה, *project, plan*.

[8] Or רגלי.

This content downloaded from

All use subject to https://about.jstor.org/terms

to the editors of the Corpus, would date from 275. The inscription therefore dates 143 from the Republic of Tyre or 132 B. C.

Another inscription found near Tyre much later and commented upon by Clermont-Ganneau[9] dates from the era of Ptolemaean dominion. The following is the passage concerning the eras:

בשת XVI לפתלמים אדן מלכם האדר פּעֵל נעַם בן פתלמים
וארסנאם אלן אַחַים שלש חמשם שת לעם [צר]

'In the year XVI of Ptolemy, the lord of kings, the powerful, the benefactor, son of Ptolemy and Arsinoë, the tree of life, fifty-three years to the people of Tyre.'

Here the date is certain; it is Ptolemy III Euergetes (247–221 B. C.) who is alluded to. The Tyrian republic having been founded in the year 275, the date would be 222 B. C.

As to the Republic of Zidon of the same epoch, we possess an inscription discovered at Piraeus (near Athens) where we read the following date:[10]

בים IV למרזח בשנת XV לעם צדן

'On the fourth day of (the month) Marzeaḥ[11] in the year XV of the people of Zidon.'

These documents show us that the term עם is employed as an equivalent of republic. It is the sovereign people that signs the acts.

Unfortunately we do not possess any data concerning the social and political constitution of the republics of Tyre and Zidon of a later date. On the other hand, we are well informed as to the constitutional régime of the daughter republic of Tyre—that of the famous Carthage and her dependent states. The testimonies of Aristotle and Polybius are precious,[12] and the

inscriptions are very numerous although some of them still remain unpublished. I have already had occasion to demonstrate in what respects the constitution of Carthage offers analogies with that of post-exilic Judea, analogies which even go so far as a common terminology.[13]

The whole constitutional régime of ancient Judea is found copied and frequently glossed in the inscriptions of Carthage or her dependencies of the occidental Mediterranean region.

At the head of the constitution of Carthage stood the δῆμος. It is to the people that the government addressed itself whenever an important decision came up.[14] The people constituted the highest court of appeal in all matters pertaining to the political life of the republic. Now, the epigraphic texts show explicitly that in the Hebrew-Phoenician speech of Carthage and her dependencies it is the term עם which replaces that of δῆμος in Aristotle, Diodorus of Sicily, and Polybius whenever there is reference to the constitution of Carthage. Several Zidonians naturalized in Carthage employ in their votive texts the following formula (cp. *CIS.*, 269, 271, 272, 273, &c.): עם[15] למיעמם קרתחדשת = ex decreto populi Carthaginis.

The inscription of Gozzo (Gaulos near Malta, see *CIS.*, I, No. 132) speaks of temples erected by the people of that city in the following terms:

. . . [המקדשים] פעל וחדש עם גול אית שלש

'The people of Gaulos executed the renovation of the three [temples] . . .'

In the inscriptions, No. 263–8, the representatives of the עם or commonwealth of other Punic colonies (e. g. עם רשמלקרת, עם אירנים, &c.) are involved. Thus every Phœnician colony

[13] See my *La Civil. hébr. et phén. de Carthage.*

[14] Cp. Diodor. 14. 4; Polyb. 15. 1, 2.

[15] This term is hardly clear. The root עמם means to charge, perhaps לָמּוֹ יעמם = he charged them. The Latin *ex decreto* translated by the editors of the Corpus is certain.

constituted a nation, a עם, which distinguished her from the other neighbouring populations. But what was exactly the character of this עם or δῆμος which governed the destinies of the great Republic of Carthage and her sister cities? Here again Aristotle, corroborated by the testimony of Polybius and elucidated by Meltzer, offers a solution:

It follows from these data that the people of Carthage were presided over by a great assembly, Syncletos, composed first of 100 and later of 300 family heads. Evidently not anybody who wished formed the sovereign people of Carthage, but only the representatives of the Phoenician citizens, one from each family, the ראשי עם or ראשי בתי אב of the Hebrews and of the book of Nehemiah, which form a point of discussion in Judge Sulzberger's treatise. By its origin it recalls the כנסת הגדולה of Jerusalem, whose inception is stated clearly in Neh. 5. 10, where it is resolved to have the first legislative reunion of post-exilic Jerusalem: twenty-three representatives of the families of the Aaronides, seventeen heads of Levitic families, and forty-five heads of lay families. See, moreover, Neh. 8. 13: נאספו ראשי האבות לכל העם הכהנים והלוים.

With reference to the Aaronides as well as the Judeans, it is the representatives of the families who make up the עם. Hence at Carthage as well as at Jerusalem the עם is the pure race, the commonwealth represented by its family chiefs, to the exclusion of strangers. It is this assembly which controls the acts of the suffetes, which presides over all the functions of government, such as the executive function, the Synhedrion[16] or the Senate of 100 at Carthage and of 70 at Jerusalem, &c. At Jerusalem the two suffetes are replaced by the high-priest and the Nasi, later on by the זוגות or chiefs of Synhedrion. The members of this parliament bear the name חברים. Thus in one of the inscriptions recently discovered at Carthage[17] we find חברנם (=חברים) alongside of suffetes and high-priests. In Jeru-

[16] The term Synhedrion appears similarly at Carthage.

[17] To appear in the next issue of the *CIS.*, which is now in press; cp. *CIS.*, I, No. 165.

salem these חברים are met with in the following numismatic text published by de Vogué:

יוחנן הכהן הגדול וחבר היהודים

'Johanan the high-priest and the college of the Jews.'

But even the term *hetairia* which Aristotle attributes to the supreme tribunal of Carthage is known in Jerusalem. In the first place we find the term החבורה (Midr. r. שיר השירים, 2. 63, &c.) used with reference to the great Jewish tribunal. But besides we have the misunderstood term בעלי תרסין or members of the *hetairia*. The key to this solution is furnished by Yebamot 121 a, where we read היתרים, *hetairias*.

I hope again to treat this captivating subject at some future date. But the present exposition, however summary it may be, proves sufficiently that the thesis of Judge Sulzberger finds very serious support in the texts of Phoenicia: under the form of family representation, the families being only those belonging to the Phoenician commonwealth, the people of Tyre or Carthage, the δῆμος or the עם, directed the destinies of their republics. This is the first form known in the history of the régime of a sovereign people.

Paris. NAHUM SLOUSCH.

PREFACE

{By the Curator of the Lewis Collection)

THE essays here collected were, with the exception of Professor Bury's, delivered as informal lectures during the Lent Term of this year at Corpus Christi College, Cambridge.

On at least two occasions in its history the College has benefited in a fashion quite out of the ordinary by the munificence of its alumni. In 1 574 the manuscript collection of Archbishop Parker was deposited in our Library : and a little over three hundred years later Samuel Savage Lewis, Fellow of Corpus and sometime custodian of the Parker Manuscripts, left to the Society a collection of objects of ancient art, vases, coins and gems, the accumulation of which had been a life-work \ Different as they are, these gifts have two features in common — compassable bulk and extreme variety, characteristics which have given them, apart from any other, a special educational value. Not a few with their triposes recently behind them have learnt at first hand under the auspices of the Elizabethan archbishop or the Victorian fellow the alphabet of advanced study.

^ An indication of the contents of the Lewis Collection is given in an appendix.

It is at least arguable, in the case of abler men, whether the three years which follow graduation be not as important as the three years which precede it. For those pursuing an academic career this can hardly be in question. Few go far in that career, who can not point back to some kind of inspiration, personal or impersonal, which at this critical period turned their energies to work which provoked their powers. A series of informal discussions of the Hellenistic Age, conducted by experts and open to the classical and historical scholars of Corpus and other colleges, was but a logical development of the employment of the Lewis Collection as a stimulus to graduate work. How suitable was the choice at this moment of this period, how instant its problems, how romantic this vast new sea of history which still remains inadequately charted, can best be told by the distinguished mariners who, with at present but few others, have sailed often and far upon it and brought back their argosies. To them not merely conventional gratitude is due. All scholars might not have been so prodigal of their unpublished results, but their generosity made the course of lectures as it now makes this book. No attempt has been made to rewrite the three

addresses for publication. Their charm and freshness, when first delivered, suggested the desirability of preservation in permanent shape, and the value of an additional essay by Professor Bury requires no comment.

The book which has resulted is not exhaustive, for there are other aspects of the Age which might have been similarly treated, but no one can read it without understanding better both the nature of the material which exists for a study of the period as also the aim and the methods with which scholars are at work upon it.

G. B.

Michaelmas 1923

THE HELLENISTIC AGE AND THE HISTORY OF CIVILIZATION

THE habit of treating what is, not very happily, called the Hellenistic age as if it were no more than a wayside inn in which a historical student travelling from Athens and Sparta to Rome is forced reluctantly to halt for a few tedious hours is not yet obsolete. This short survey is designed to illustrate and underline its importance and interest for the subsequent history of civilization.

The period of Greek history from the conquest of Alexander the Great, who worked a miracle that seemed to break the continuous course of history by a long leap, down to Rome's completion of her Eastern conquests by the annexation of Egypt, has been until comparatively recent years exceptionally unfortunate, in not being studied for its own sake, and therefore in not having its definite and eminent place in the general history of the world properly understood. It has entered little into liberal education except so far as it is involved in the history of the Roman Republic. An ordinary reader of Roman history will just hear of the brilliant Academician Carneades and the wise Stoic Panaetius of Rhodes, because they visited and impressed Rome ; but he knows hardly anything as a rule of the Greece in which these men of light and leading had been brought up. The art of that period can

not be ignored ; it appeals to the eye, in originals

or copies, in every large European collection ; but the visitor to the museums who knows all about the ages of Pheidias and Praxiteles is astonishingly ignorant of the world in which the Venus of Melos or the Dying Gaul was chiselled. A generation ago boys used to learn geometry in the handbook of Euclid, but the few who had a vague notion that "Euclid" was the name of the author had no idea who he was or when he lived ; if he had lived in the fifth century and not in the age of Ptolemy Soter, many of the schoolboys, and possibly some of the masters, would have known at least that he was a Greek. For there was a notion prevalent that the Greeks were already decadent in the third century ; it has perhaps hardly died out yet, and has probably been the principal cause of the neglect of the post-Demosthenic age. Nothing could be more untrue. That vague and facile word "decadent" is often misused, but no misuse could be more flagrant than to apply it to the Greeks of the third and second centuries. The age of the political greatness of their cities was indeed over, but they still possessed creative strength and were as hot as ever on the quest of truth. In completely altered circumstances they were doing new and valuable things and were expressing the Hellenic spirit in new and valuable ways. Their highest intellectual endeavours were now in the field of the exact sciences and this was the age of their greatest mathematicians.

For anyone who is interested in exploring the history of European civilization and finding out how the past is stored in the present, this period of Hellenism may be said in a certain way to cpunt

more than the age of the independent city states ; for it was through this period that the earlier age exerted its influence. It was in this period that the culture of Rome was semi-hellenized and it was

through Rome that Greece leavened the civiliza-
tion of Western Europe. We must remember that
when a Roman went to Athens or Rhodes or Alex-
andria he imbibed the ideas ar^d culture of the living
Greece of the time ; this training would include a
knowledge of her past, but the past would be seen
by him as by a native Greek through the glasses of
the present. The Latin poets (except Horace) in
the first century b.c. owed more to the compara-
tively modern Greek poets, the Alexandrines, than
they owed to the older and greater poets of the
great age of Hellas ; and it was the contemporary
art of Greece that appealed to the taste of Roman
connoisseurs and supplied models to Roman artists.

To judge the value of any section in the line of
human events for the progress of civilization and
to apprehend its significance for the sections that
followed, it is not enough to make a catalogue of
the achievements and the discoveries. We cannot
appreciate it by bare outstanding results. We must
recreate the life of the age for its own sake, seek to
live it over again and to understand the problems
which faced the rulers and the thinkers and how
they tried to solve them.

To aid us in making the attempt, we have now
much more material than Droysen had, when he
wrote his valuable History of Hellenism. Within the
last generation the discovery of a mass of con-
temporary documents, inscriptions, and still more
papyri, has given a powerful stimulus to the study

of the period, and for a good many years past a
number of savants have been engaged on an in-
tensive study of the political, economic, and social
life under the Macedonian monarchies. But the
results of their work have so far hardly penetrated
beyond learned circles into the general knowledge
of the educated public.

The period is itself extraordinarily interesting,
though it is a period in which there is no difficulty
in losing one's way. The change so suddenly
wrought by Alexander in his ten miraculous years,
substituting European for Asiatic rule all over the
Near East, set problems which no European states-
man had ever had to face before. The new rulers

had to steer their ships over unfamiliar waters by strange stars. Large political and social problems were raised. New material and unexpected opportunities were given to Greek science, to advance in its endeavours to comprehend man's environment. The change meant an economic revolution resembling, on a smaller scale, that which was brought about by the discovery of the lands of the Western hemisphere and the circumnavigation of the earth eighteen hundred years later.

The effect of this revolution was that between the fourth century and the end of the third a long step was taken on the road which separates our civilization to-day from that of the fifth century b.c. That is another way of putting Mr Tarn's observation about the third century that it strikes one as comparatively "modern." If a European of to-day were precipitated backward through time by a sorcerer's spell into some Hellenic town of the past he would much sooner get used to his new sur-

roundings, if they were in one of the great Greek cities founded by the Macedonians, Alexandria or Seleucia or Antioch, than if he were cast into the Athens or Syracuse of a hundred years further back. There was business enterprise on a considerable scale. The seas were not deserted by ships in winter, as they had been in the previous century. Now that Eastern trade had been thrown open to Greeks, the profits to be made were so large that merchants braved the dangers of winter voyages in a way that in old days was unknown. It has been suggested that the popular astronomical poem of Aratus which was so much admired by the ancients was composed with an eye to the need of a handbook for mariners. It is on the practical uses of astronomical knowledge that the poet insists. The volume of trade had grown so large that banking and exchange assumed great importance. The monetary transactions of this period, the state banks of Egypt, the international bank of Rhodes, were as far beyond the vision of the Delphic priests, or of Pasion and his clients in the days of Demosthenes, as the banking business of modern times was beyond the vision of the founders of the Bank of England.

The society of this age was tolerant; people

did not trouble much about the beliefs of their neighbours ; thought was perfectly free. The power of the Olympian gods, who had now to share their divinity with mortal potentates, was virtually over. There was only one deity in whom nearly every one believed, the goddess Fortune. If people did not know that the earth moves, it was now part of common knowledge that the earth is round ; and

the gibes with which Aristophanes derided Socrates for trying to compute its diameter or circumference would now have fallen flat.

There had indeed been one occasion when the existence of the philosophical schools of Athens was seriously threatened, not however for orthodox but for political reasons, and the episode is of considerable interest. It happened when the democracy was restored on the arrival of King Demetrius in B.C. 307, and Demetrius of Phalerum, head of the government which was overthrown, had to flee. New laws were drawn up and one of these, proposed by a certain Sophocles of Sunium, suppressed the philosophical schools, the Academe and the Peripatos, and ordained that no such school should be established in future without the licence of the state. The law was aimed particularly at the Peripatetics because the head of that school, Theophrastus, had been an intimate friend and adviser of Demetrius of Phalerum. The law was passed and Theophrastus left Athens, but public opinion changed in a few weeks or months. The Athenians felt that Socrates and Plato and Aristotle could not be described as friends of democracy, yet their genius had largely contributed to building up the reputation of the city as the centre of Hellenic culture. As a matter of fact it was discovered that the law was illegal. The legal position of the schools was that of religious clubs devoted to the worship of the Muses, and religious clubs had been recognized as legal institutions by a law of Solon. Accordingly a graphe paranomon lay against Stratocles ; it was brought by a pupil of Theophrastus, and Stratocles lost his case, although he was defended by Democharès from whose mouth,

in attacking Socrates and Plato and Aristotle and other less famous philosophers, such pearls of abuse rained as Greek orators were adepts in producing when they were in a vituperative mood. If such a law had prevailed, Athens would not have been enriched by the Garden of Epicurus or the Porch of Zeno\

Alexander's death at the age of 32 was a contingency which altered the course of history to an extent which it might be possible vaguely to conjecture if we knew what his immediate projects were. Unfortunately we do not know his projects. There is no good evidence for the popular idea that he was bent on the conquest of the whole world. It used to be thought that we had some genuine indication of his plans in a document known as his Hypomnemata.

But very recently Mr Tarn has shown convincingly that the Hypomnemata were a fabrication, so we have nothing like positive evidence to go upon. It is however certain that before his death Alexander must have been considering the future, and it would be natural that he should discuss his plans with his generals. We may therefore ask the question whether the ideas which Arrian (by whom the spurious Hypomnemata were not used) put in the mouth of Alexander (v, 26, 1–3) and in that of Coenus son of Polemocrates (ib. 27, 7) were derived from material supplied in his principal sources, the Memoirs of Ptolemy and Aristobulus, or from the popular history of Cleitarchus. For, if from the

^ The best account of this incident will be found in Mr Ferguson's Hellenistic Athens, pp. 104 sqq.

former, it would be permissible to infer that three plans had been under coTisideration : (i) a new Eastern campaign to complete the conquest of India, (2) a northern expedition to Scythia and the countries round the Caspian, and (3) an extension of the Empire in Africa. What we do positively know is that since his visit to India the king had been much occupied with maritime questions. His admiral had made the sea voyage from the Indus to the Euphrates, and was preparing to attempt to circumnavigate Arabia and to establish a route by

sea from Babylonia to Egypt. In the valleys of the Nile and of the Tigris and Euphrates, Alexander possessed two rich store-houses, like the Persians before him. But the Persians had allowed the cultivation of Egypt to fall into decay, and one of the most profitable tasks for its new king — a task to which the Ptolemies afterwards addressed themselves with marked success — was to renovate Egyptian agriculture and restore the productiveness of the land to its condition under the old Egyptian Empire. This would have been one of the first items in the economic organization of the Empire which Alexander must have undertaken. We know also that the situation in Macedonia was urgently demanding his presence. It seems therefore probable that before embarking on any further enterprises in the East, he would have returned to the West and organized Alexandria as a second capital. And with his increasing insight into the importance of the sea, it is not a bold hypothesis that he would have aimed at establishing a thalassocracy in the whole Mediterranean. This would have meant the conquest of Carthage, and the conquest of Carthage by

the Macedonian, who combined military genius and the command of immense resources, would have been no long task. So far we may go in our surmises, and if Alexander had done nothing more than that, the history of Rome, without its Punic Wars, would have been altered in ways we cannot imagine. A supposition of this kind is not idle. There is no sound reason for not recognizing, with Sir John Seeley, as legitimate and useful, the device of considering what might have been, in order to help one to realize the significance of what actually was.

None of Alexander's successors attempted to dominate the whole Mediterranean, an achievement reserved for Rome. Among the generals who fought over his inheritance, there were many of high military competence and some of uncommon political ability, but none had the sweep and power of their master's mind, none the spell of his personality. The only one who at all resembled him was Demetrius the son of Antigonus, who in military brilliancy might be compared longo interuallo to Alexander and had remarkable personal charm. But he had ∗'some vicious mole of nature" in him, and he was not the man to rule an empire; he

knew how to conquer, as Mr Tarn has said, but did not know how to govern.

Out of the conflicts which occupied many years after Alexander's death there ultimately emerged three great powers, each of which performed a different task, and while they were quarrelling over Greece, Syria or Asia Minor were all deliberately spreading Hellenism and unconsciously preparing the way for Roman dominion. The Antigonids of Macedonia were the protectors of the centres of Greek

culture against the barbarians of central Europe who were pressing on the Danube ; the Seleucids preserved Hellenism in the East and made the Parthians less barbarous ; the Ptolemies prepared and set in order the store-house of Egypt which was to be Rome's richest possession.

It was the second Ptolemy who began methodically in the middle of his reign the operation of restoring the economic life of Egypt and making the soil yield all that it was capable of. By what methods this was done can be elicited from contemporary papyri and has been elucidated by Mr Rostovtsev in his masterly study A Large Estate in Egypt in the Third Century b.c} Ptolemy carried the work out as a landlord managing his own personal estate, during the last fifteen years of his reign, with the help of his trusted dioecetes or economic minister Apollonius, and ample remains of the correspondence of Zeno, who was the man of business (oeconomus) of Apollonius, have been preserved and supply rich information as to the lines which were followed in improving cultivation, irrigating sandy land, draining marshlands, constructing dykes, introducing viticulture, improving stocks, and organizing the administration. Mr Rostovtsev characterizes the work as a "systematic and logically progressive" exploitation of the resources of the country. It was carried out under the direction of Greeks, and its effects were durable.

All these Macedonian monarchs were champions of Hellenism ; all of them, much as some might depart in practice from Hellenic ideals, believed devoutly that Hellenic culture was the most

^ Wisconsin, 1922.

precious thing that humanity had produced. The Macedonians had fought for Greece in the Persian invasion and they had received as it were letters of naturalization in b.c, 476 when they were admitted to take part in the ©lympian games. Though they were thus recognized as not barbarians, they continued to be regarded by the city states of Hellas as outsiders. Their political institutions differed and also their customs. The marriage of brother and sister, incestuous in the eyes of the Hellenes, was practised in Macedonia and the hellenized Macedonian monarchs never learned to consider it as abominable. Thus while Alexander's conquest meant the expansion of the Hellenic world, we must not forget that its rulers came of a state deeply differentiated from the cities which had a long tradition of Greek culture, and they were more capable of ruling successfully non-Greek peoples. It may be doubted whether any of the statesmen who made history in the old city states would have been as successful in governing large heterogeneous kingdoms as were the ablest of the Macedonian despots. One characteristic of these kingdoms, which was distinctly Macedonian, was the considerable part which women of the royal houses played in political history, not on the whole a beneficent part, from Olympias to the last Cleopatra. The^e Stratonices and Laodices, Berenices and Arsinoes cannot be reproached either for cowardice or for scrupulousness.

It was only for about a hundred years that these monarchies, along with the small kingdom of Pergamum and some other minor states, went on their ways, little disturbed by what went on outside

the Hellenic world. From B.C. 200 the shadow of Rome was imminent over them. Ptolemy Philopator and Attalus of Pergamum were perhaps among the first to realize that the future lay with the rising Western power. In the nineties of the second century, after the field of Cynoscephalae, it needed no Delphic inspiration to enable the poet of the Alexandra to speak of Rome's supremacy by land and sea

7^9 KcCi 6a\aaaij<i arKrJTTTpa koI fiovap'x^iav (1. 1229).

The story of the Roman annexations east of the Adriatic has been usually studied and usually told entirely from the Roman point of view. In order to understand Roman polic)"" and judge it, we must look at it also from the point of view of the states that were its victims and observe events from Pella or Antioch or Alexandria or Pergamum as well as from Rome. Roman historians have procured currency for the view that Rome was involved in the politics of the Balkan Peninsula and Hither Asia against her will ; that all her operations were entirely defensive, necessitated by the aggressive designs of the Macedonian states ; that her conquests were the unavoidable and uncalculated result of measures which she was compelled to take in order to escape destruction; that her empire was neither desired nor designed but forced upon her. That was, no doubt, the perfectly sincere opinion of the generality of Romans. We have a modern parallel near home. It is probably the genuine opinion of many Englishmen that in the formation of the British Empire, English governments were never guilty of any aggressive purpose

and were only forced by circumstances from time to time to take territories which they did not desire, either in self-defence or for the good of the world. But this is not a view which is accepted by other nations, who regard it as merely an expression of English hypocrisy. Rome's claim to be inoifensive and innocent of any desire for aggrandizement must have seemed singularly hypocritical to the despots whom she bullied and terrorized during the century after the Punic Wars. If we examine her acts and neglect the gloss she put upon them, we cannot help seeing, as Mr Bouch6-Leclercq has seen, how perfidious the policy of her government must have seemed to the Eastern powers. In modern times, since the rise of democracies, despotic kings have not been greatly in favour, and it has been exhilarating and edifying to see proud monarchs trembling at the word of a plain Roman who represented a republic and disdained pomp and state ; and in gazing on this admirable spectacle people have neglected the fact that the government of the Republic was an oligarchy as grasping and greedy as any of the majesties whom its consuls

and ambassadors humiliated. It is needful to know not only the history of Rome herself but also the history of the Greek monarchs, and to realize not only her, but also their, political and social conditions in order to form a just view of her behaviour. It must also be remembered that Rome was afterwards confronted by the same problems that tested the abilities of the Macedonian rulers, when she took their place — such as the conciliation of central government with regional autonomy, the treatment of Oriental nations and of wild backward

sections of mankind. She inherited their problems and she also learned from their solutions. In studying the Roman administration of Egypt or the exceptional position of many Greek cities under the early Principate, or even the way in which the earlier Emperors managed their financial business, we are inevitably led back to the methods of Alexander's successors. The deification of the Emperors is directly derived from the Macedonians ; the device of maintaining a dynasty without sacrificing the elective principle, characteristic of the Roman Empire, was a Seleucid invention. To understand the origin and nature of the colonatus^ its latest historian takes us back to the landed estates in Ptolemaic Egypt..

It has I think been said that there was a certain continuity in the traditions and fashions of monarchical courts, passing from the Ptolemies and Seleucids to the Roman Emperors, and thence coming down through the Middle Ages to modern times. Now there are certainly remarkable resemblances between the court institutions of the Ptolemaic and Seleucid autocracies and the Roman autocracy into which the Principate passed towards the end of the third century, but the continuity through the intervening centuries of the Principate is not very apparent. I am disposed to think that the resemblances are due to a continuity, not in the "West but in the East. The courts of the absolute monarchs of Egypt and Syria were strongly influenced by the Persian court of the Achaemenids, and the Oriental features which were adopted by Aurelian, Diocletian and Constantine,came from the Persian court of the Sassanids. It is a persist-

ence of Achaemenid tradition through the Parthian period rather than a persistence of Seleucid tradition through the Roman Principate that accounts for the similarities which are noted between the Roman autocrats and the Macedonian autocrats. We may indeed say that the influence of ancient Persia in modern Europe has not yet been fully recognized. It is to be found not only in the general fashions and etiquette of royal courts, but also in the habits and traditions of diplomatic intercourse. It was the relations between Roman Emperors and Sassanid monarchs that developed the strict conventions observed at Constantinople in dealing with foreign states and learned readily enough at other European courts, for in the Middle Ages Constantinople was in many ways the school of Europe.

It will hardly be contested that the considerations summarized in the foregoing pages supply good grounds for assigning to the period of the Macedonian monarchies a more leading and assured place in the study of ancient history than it has hitherto been permitted to occupy.

From the point of view of the progress of man, a great increase in knowledge of his environment or a great increase of his power over nature, has more wide-reaching effects and is a more signal landmark in history than any political changes. The invention of printing was a more important event than the Reformation, the discovery of the American continent more important than the conquests of the Turks.

In these respects our period is not an outstanding landmark in universal history ; its interest is

that it was on the verge of great discoveries, but came to an end without having made any absolutely decisive advance, or any momentous break with the past. It had its Copernicus ; it had an explorer who has been compared to Columbus; but neither of them moved the world.

Aristarchus of Samos (active b.c. 290–260) demonstrated that the geocentric system of astro-

nomy then in vogue could not be true as it did not explain the phenomena, and he hit upon the helio-centric hypothesis including the diurnal revolution of the earth round its axis. It was a flash of genius, and Aristarchus will always be remembered as the first man, so far as we know, who knew the general truth about the solar system. So far as we know ; for he may have been anticipated by some forgotten Babylonian savant. To be first with a scientific discovery seems to be as hard as it was to be first in getting into the pool of Bethesda.

But what happened to be the truth was not received. The new theory must have made a certain sensation and it is interesting to find it denounced on religious grounds just as eighteen hundred years later, when it was revived by Copernicus, religious prejudices were one of the obstacles to its reception.

Of the philosophical schools which were acquir-ing such great influence in the third century, the Stoic was that which had most affinities with a religious community — it has been compared to a Church — and it was the head of the Stoic school, Cleanthes, who raised his voice against a man of science. The Greeks, said Cleanthes, ought to impeach Aristarchus for impiety for disturbing the

hearth of the universe and dragging it to another place. The days were past in Greece for intoler-ance of this kind ; in no age perhaps was the ex-pression of opinion freer or rationalism more widely spread than in Hellenic lands in the third century B.C. The denunciation of Cleanthes could do no harm to Aristarchus, in fact it could only serve as an advertisement for his theory.

Why then in such an intellectual atmosphere was not the heliocentric discovery accepted ? Why did the leading savants of the following genera-tions decline to entertain it ^ They were obliged to concede to Aristarchus that the current theory would not do, but they rejected his solution as too audacious. I am not sure, that they had not, as Mr Beloch has argued, a good case. This revo-lutionary theory, they might say, accounts for the observed phenomena; but otherwise there is no positive ground for any of the assumptions which

it implies. If another hypothesis can be found that explains the celestial movements without disturbing the view that the earth is the centre of the planetary system, it deserves preference. And then the great mathematician, ApoUonius of Perga, came forward with the ingenious theory of epicycles which, leaving the earth undisturbed and comfortable in its old central home, seemed to furnish a full mathematical explanation of the movements of the heavenly bodies. This was the final word of Greek science and it prevailed unchallenged to the six-teenth century. When we remember that the Copernican theory did not convince a man like Lord Bacon, nor win general acceptance until the telescopic observations of Galileo confirmed it, I

do not think we can blame the Greeks very much. They were on the verge of recognizing the truth, which if it had been recognized would have changed the history of the thought of the next two thousand years and produced incalculable effects. We may say that the judgment of the most eminent Greek mathematicians, Archimedes, Apollonius, Conon, Hipparchus, decided a problem of vast importance for human progress and, as it turned out, decided it in the wrong way.

In the growth of man's acquaintance with the earth from the limited conceptions of the early Greeks to the full knowledge of the configuration of its lands and seas to which he has now attained, we may distinguish two Greek stages, and the time of Alexander the Great marks the beginning of the second. Both stages ensued directly from political movements ; the first from Greek colonisation in the Western Mediterranean and the Euxine, the second from Alexander's conquests.

In the first period, the two most important steps were the invention of map-making by an Ionian philosopher and the epoch-making discovery that the earth is a globe, due to some Pythagorean man of genius. The study of geography never stood still from the time of Herodotus to that of Aris-totle, and one result of observation and reflexion was to discredit the authority of the Ionian maps. Yet these maps continued in use down to the end

of the fourth century. Then Alexander's penetration of the East as far as the Punjab and the voyage of his admiral, Nearchus, in the Indian Ocean, gave a new and powerful stimulus to the science of geography which the Greeks had founded.

And about the same time at which the eyes of the Greek world, amazed by Alexander's triumphal progress, were riveted on the East, new geographical facts were being gathered in the West in a region of which the Greeks were far more ignorant thanthey wereof the Persian Empire — andgathered not as gleanings incidental to a military expedition, but as the fruits of the private enterprise of a genuine explorer who had no economic or political aims. Of Pytheas of Marseilles we know tantalizingly little. He sailed along the Atlantic coast of Europe, corrected old erroneous views as to the orientation of the coasts of Gaul and Spain, visited Britain and probably circumnavigated it, and returning to the continent, travelled along the coast of the North Sea perhaps as far as the Elbe. He observed the noonday altitude of the sun at various places in these northern latitudes. One of his objects was to assist in solving what was one of the main problems of geographers at this time, whether the inhabited world is an island entirely surrounded by oceanic waters and what its shape is. The name of the book in which he recorded his discoveries is significant, A Treatise on the Ocean. It was published somewhere about b.c. 320; it was not known to Aristotle but was known to his pupil Dicaearchus. Greek geographers had known since the sixth century of the existence of lerne, and of Britain under its oldest known name Albion, through information collected at Marseilles from Tartessian traders. Pytheas was the first to reveal to the Greeks roughly accurate facts about Britain collected at first hand. He has been described as "the Columbus of antiquity." He was not a rich man

and what we should particularly like to know is under what conditions he made his voyage from Cadiz and in whose ship. The Carthaginians who were masters at Cadiz did not encourage Greeks sailing in the Ocean.

But Pytheas never got the credit he deserved. He supplied data which were indispensable to the construction of a new world-map and Eratosthenes, the greatest of Greek geographers, seems to have recognized the value of his discoveries. Yet Dicaearchus, the predecessor of Eratosthenes, distrusted him, though he appears to have used him, and Polybius roundly declared that he was a liar.

The history of the geographical labours of the Greeks from Aristotle to Poseidonius is a difficult but fascinating study \ One hardly knows whether to admire more the deductions of Eratosthenes, from the limited material available to him and the map which he ventured to construct, or the criticisms which his map evoked from the illustrious astronomer Hipparchus and the principles which he laid down for making a true map. Eratosthenes, working on the information furnished by Pytheas and the equally defective and possibly more misleading information that was available about the far East, was convinced that the oecumene or "inhabited world" was an island, and that the ocean around it was continuous. He thought that this was proved by observation except at two points, the

* Even after the work of Mr Berger, there is much still to be done. The latest work on Eratosthenes, by Mr Thalamas {Etude bibliographique de la geographie d'Eratostkhe, Versailles, 1 921), illustrates the difficult questions that arise as to his writings.

extreme south and the extreme north, and that the chances that at those two points therewas an isthmus of solid land were negligible. He seems to have been misled by the confidence with which those who brought back reports from the East took it for granted that the East coast of India marked the eastern limit of the oecumene, and he accepted the statement of Patrocles, that the Caspian was a gulf of the ocean in the north-east. It must be remembered that it was not till Roman times that anything appears to have been known about Further India and Catti-gara (which maybe Singapore). But inadequate as the grounds were on which Eratosthenes concluded that the oecumene known to him was surrounded by sea, immense as were the tracts of whose existence he had no idea, his general hypothesis was right,

whereas the view of Ptolemy, who lived three centuries later, and knew in consequence of the Roman conquests far more geographical facts, and had the last word in ancient geography, — his view that the Indian Ocean was entirely surrounded by land missed the mark.

Eratosthenes contemplated the possibility of sailing all the way in the same latitude from Spain to India if only the distance were not so great — |he reckons it as over 13,000 miles^ — and this was the view that prevailed till Columbus found the fWestern Oecumene. It was the view of Columbus limself, the view with which he started and indeed the view he held till his death, for he never knew that the lands which he had discovered were a new

^ Eratosthenes calculated the circumference of the earth to be about 28,000 miles. The true figure is 24,860. Considering the nature of his data this is an amazingly close approximation.

continent. But Eratosthenes only put forward this as one possibility. He also contemplated the possible existence of another or more than one oecumene in the Western Hemisphere \ Which possibility he preferred we do not know.

The Greek geographers of the third and second centuries might have reached more accurate results had they devised and realized some scheme of voluntary cooperation or had the governments of the time given them active support. But cooperation in scientific research is a comparatively modern thing, though Hipparchus perhaps had a notion of ; it ; and the successors of Alexander did not appre- \ ciate, as the Romans did, the practical value of maps. It is true that some of the Ptolemies promoted expeditions for the purpose of geographical discovery, but their interests extended only to the Red Sea, Ethiopia and the Ivory Coast, and to the Indian Ocean. The Seleucids did less than they might have done to promote the knowledge of Further Asia ; and if Megasthenes and De'lmachus brought back some knowledge of Bengal, the missions on which they were sent to Palimbothra by Seleucus I and Antiochus I were political. The monarchs who inherited Alexander's dominions did not realize, as his imagination and genius had enabled • him to realize, the importance of geographical work.

He had Greek specialists with him whose business it was to record geographical observations, especially measurements of distances. These memoranda were

^ I think that Mr Berger's conclusions are justified, Geschichte der wissenschaftlicken Erdkunde der Griechen,Tp. 398 (ed. 2, 1903).

' Demodamas, however, a general of Seleucus, penetrated beyond the Jaxartes, and wrote a book on the country.

carefully kept in charge of the royal treasurer, who after the king's death handed them over to Patrocles, the geographer to whom had been entrusted the exploration of the Caspian Sea and who succeeded (under Seleucus) in establishing the untruth that it was a gulf of the ocean. It is remarkable that on this point Herodotus had known the truth.

We may say on the whole that while the creation of geographical science by the Greeks is one of the eminent facts in the history of civilization, and while ; the study was prosecuted during this period with – such notable success (due to the progress of mathe- matics as well as to exploration) that the period may be called the great age of Greek geography, yet no discovery that could be described as revolutionary was made in it, nothing comparable to the Pytha- gorean discovery of the earth's spherical shape in the fifth century or even to the Ionian invention of maps in the sixth.

I must just signalize – I have not space to enlarge on – one other intellectual movement in the third century, which had a more permanent effect than the brilliant researches into astronomy and geography. It is well known. Philological science was founded at Alexandria, and systematic critical inquiries into the whole body of extant Greek literature began. The movement issued from the Peripatetic school – Aristotle was the pioneer in Greek erudition – and it was made possible by the foundation of the Alexandrian Museum, with its famous Library, of which the idea was due to the enlightened Peripa- tetic Demetrius of Phalerum when he was an exile from Athens under the protection of Ptolemy Soter. That was an event. Its consequences are written

all over the world ; we should not recognize our civilization if they were absent. Our public libraries, museums, academies of science and learning, universities have all a common parentage in the great institution which was under the patronage of the Ptolemies.

We may now go on to inquire whether any new original social idea was set afloat that influenced the course of civilization. The ideas which were particularly characteristic of the time and are most prominent, Imperialism, the divinity of sovrans, the legitimacy of absolute rule, were all important for the future, but none of them was new though they all entered on a new stage. But one idea then launched upon the world was quite new and was destined to control the future.

It has, I believe, been maintained that the word "barbarian" first acquired its depreciatory meaning in the fourth century, and from being a neutral term equivalent to non-Greek came to imply moral and intellectual inferiority. It is true that the idea of the inferiority of all non-Greek peoples to the [Greek was diffused and generally accepted in the Greek world in the fourth century but it certainly originated in the fifth. I think we may say with some confidence that the Athenians were responsible for the diffusion of this prejudice. We first find it in Attic literature or in literature directly under Attic influence. We find it very clearly in Euripides; for instance in the Medea, in the Iphigenia in Aulis, and especially in the Andromache. Thus in the 7)&>6/-genia in A u lis we mett the declaration that "It accords with the fitness of things that barbarians should be subject to Greeks, for Greeks are freemen and bar-

barians are slaves by nature." We find it also in Herodotus, and the evidence from Herodotus seems to be very significant. In the first six books, up to the battle of Marathon, the word occurs about a dozen times, and always in the neutral sense of non-Greek. In reading those books you can understand how an ancient critic blamed him for being philo-barbarian. It is only in the last books, written when Herodotus had come under Attic influence, that we find the word occasionally used with a derogatory implication^ and constantly

as a synonym for the Persians ^ We are, I think, entitled to conclude that the theory of the inferiority of the barbarians was started after the Persian Wars, probably at Athens, was propagated from this "School of Hellas," and became in the fourth century a dogma accepted throughout the Greek world, firmly held by men like Aristotle and Isocrates. Xenophon, who had seen something of the wider world, was one of the few dissentients.

This belief of the Greeks in their privileged position among the peoples of the earth — which was as strong as the belief of the white races in their superiority to the coloured races to-day — lasted long after they had lost their political independence. They said, "We Greeks are great and good. As for the barbarians, they may learn from us but they must be kept in their place." Their eminent intellectual and artistic attainments, all they did for our own civilization, may prompt us

' VII, 35; VIII, 142; IX, 79.

^ I count 37 times in Book vii alone. On the other hand, in the account of the Ionic revolt "Persians" is always used, never "barbarians."

to be indulgent to this self-exaltation ; but the idea degenerated into an intolerant bigotry which a modern writer has considered a leading cause of their political decline.

There was born, however, in the generation after Alexander's death, another idea, sharply contrasted with this exclusiveness — the idea of mankind as one great community, the ideal of a state embracing the whole oecumene.

Zeno, the founder of Stoicism, established his school at Athens in b.c. 301 and taught for about forty years. Born in Cyprus he was a hellenized Semite. One of the things which his philosophy did was to overcome the distinction of Greek and barbarian. He introduced the idea of cosmopolitanism \ transcending patriotism ; of the whole world, the oecumene, as a man's true fatherland; of a community embracing all rational beings, without regard to the distinction of Greek and barbarian, or of freeman and slave. According to this doctrine

the philosopher feels himself citizen of a state to which all mankind belongs, a state whose boundaries are measured by the sun. In the ideal state of Zeno all human beings were citizens.

Now this idea was opportune ; it came at the right time. It corresponded to the great revolutionary feature in the policy of Alexander, who in organizing his Oriental empire was bent on breaking down racial antagonisms and overcoming or soften-

* It seems to have been the Cynics who invented the word cosmopolis. Zeno was a pupil of the Cynic Crates. But to the Cynics cosmopolis was hardly more than a specious reason for rejecting the responsibilities of citizenship : the Stoics transformed it into a constructive idea.

ing the distinction between Greek and barbarian. He recognized non-Greeks as part of the human family with equal claims on a common ruler.

The conception of a unity and fellowship of the human race did not do very much immediately to counteract the doctrine of the ingrained inferiority of those who were outside the Hellenic pale. It might be greeted as "a beautiful and inspiring thought"; but common sense was quite another thing. We may doubt whether this side of Stoic teaching made any appeal to such disciples as the Macedonian king, Antigonus Gonatas, who looked on Zeno as his spiritual guide, or to the Spartan king Cleomenes. The new idea did not help the plight of the native Egyptians.

But it was gradually propagated, and reached beyond Stoic circles. We hear that the great savant Eratosthenes, the librarian of Alexandria, whose geographical work has been touched upon above, censured Aristotle for advising Alexander to treat the Greeks as a leader, but the barbarians as a despot. Eratosthenes in his youth had been a disciple of Ariston of Chios, a heretical Stoic, who set up a school of his own at Athens. It may have been from Eratosthenes that Plutarch took the text for the passage in his Essay on Alexander^ which associates the actions of Alexander with the doctrine of Zeno, a memorable passage which I will quoted Having enlarged on the civilizing work of Alexander, he says, " The much admired ideal of Zeno

who founded the Stoic sect amounts to this : that we should not live in separate communities each with its own codes and laws, but that we should
^ De J lex. fort, aut virt.. Or. i, c. 6.

consider all men compatriots and fellow-citizens and that there should be one life and common order. Zeno put forward this as a dream or image of a state based on philosophical principles, but Alexander attempted to realize it. Aristotle had advised Alexander to behave to the Greeks as a leader but to the barbarians as a despot, treating the former ; as friends or kin but the latter as animals or plants. He did not follow that advice. He conceived that he was divinely sent to be the harmonizer and conciliator of Greeks and barbarians alike. He sought to blend as it were in the mixing-cup of good fellowship all civilizations and customs. He bade all men regard the world as their fatherland, not distinguishing Greek and barbarian by dress and outward appearance but making virtue and vice the criteria of distinctions among men." It is in Rome that we see this idea — the ecumenical idea, as I have called it elsewhere — bearing its earliest fruit. While the Roman upper classes had accepted from the Greeks the inferiority of the barbarians, from whom in assimilating Greek culture they dissociated themselves, they became familiar with Stoic doctrine, and it influenced the ideals of Roman administration, and the ecumenical idea dictated the claims of the Roman Empire to worldwide dominions.

Cicero says, in a passage of his Republic [i, 2], that the great motive for industry and toil among high-minded public men, is to increase the resources— not (observe) of their own country, but — of the human race and to make the life of men in general richer and safer. Cicero was not a Stoic, and this passage illustrates how the Stoic idea of

the community of the human race had penetrated beyond the professing members of the sect.

In the next century Pliny justifies the Roman Empire by its aim of providing one fatherland for

all the peoples of the world. Its ideal was to be potentially conterminous with the inhabited globe, the orbis terrarum. Coming down three hundred years into the fourth century when the Empire was threatened by the Goths, we have Themistius praising (or defending) the magnanimity of an Emperorin not pressing too far his victory over the enemy, by an appeal to this idea. "You decided justly that even the barbarians ought not to be utterly destroyed because they also are really a part of your dominion, a complementary section of human kind. Therein you prove yourself a sovran of all the human race. No member of humanity is to be deprived of your care\" But it is interesting to note how in the same breath the orator maintains the view of the inferiority of the barbarians.

Parallel to claims of the Empire and proceeding from the same origin was the claim of the Christian Church to be universal. In mediaeval theory the two claims were united. The passage I quoted from Plutarch strikes a leading note of the whole subsequent progress of man. For, apart from the increase of his knowledge and power, has there been any more salient feature in the advancing movement of human society than the linking up of all

' The idea can be illustrated abundantly by inscriptions, e.g. Julian, domino totius orbis (C.I.L. iii, 247), Valentinian I, iotius orbis Jug. {Eph. epigr. 5, 518), Theodosius, Valentinian II and Arcadius, ot t^s v^ lyXiw y^s avroKpaTopes (Dessau, I.L.S. 5809).

I

parts of the oecumene and the propagation of Western civilization, of which the foundations were laid in Greece, to all the margins of the world ? In that movement Alexander took the first step. And in modern times the confederate idea of the solidarity and fellowship of the human race has become an active and driving force. It has expressed itself as Internationalism which breaks down barriers and disowns country. It has expressed itself in the League of Nations. It is the intellectual basis of humanitarianism. It was Zeno who first taught men to think in terms of the oecumene.

i

ALEXANDRIAN LITERATURE

IN one of the works of Walter Pater there occurs the following passage : —

The trial-task of criticism in regard to literature and art no less than to philosophy begins exactly where the estimate of general conditions, of the conditions common to all the products of this or that particular age — of the "environment" — leaves off and we touch what is unique in the individual genius which contrived, after all, by force of will, to have its own masterful way with that environment.

I will not venture to dispute the general truth of Pater's dictum^ but in this lecture I have no intention of submitting myself to the test which he indicates. Dealing only incidentally with the separate appraisement of the various authors of the Hellenistic age, I wish to concern myself rather with what Pater regards as the secondary task of the critic, the description of environment and the fixing of general tendencies.

I chose this course for two reasons. Firstly, there are in existence several excellent studies of the individual writers of this epoch. Not to men-tion the general histories of Greek Literature, we have in English Dr Mackail's Lectures on Greek Poelry^, which contains three chapters on the Alex-andrian Poets ; in French the brilliant book of Couat on the same subject*^; and in Italian the more

^ Second edition, 1 9 1 1 .

* A. Couat, La Poisie Alexandrine, 1882.

recent work of Rostagni\ My second reason is connected with considerations of time. It might be profitable to spend an hour in analyzing the characteristics of Theocritus or Callimachus or Apollonius Rhodius, but it would be mere waste of time to attempt the same task in five or ten minutes, and this is all that could be spared when there is so much to be said on the general outlines.

Even when thus circumscribed the subject to be treated in my lecture remains sufficiently large and only a selection of the facts can be given. The social and political background, for instance, must mostly be taken for granted and I shall only refer indirectly to such things as the rise of the vast Hellenistic monarchies with their mixed populations and their crowded capitals, or the great increase in wealth and luxury, or the foundation of endowed institutions of learning and the advancement of science.

By virtue of these things the Hellenistic world, it has been remarked, is in many respects nearer to the world of to-day than are the Greeks of the Classical Age. This is not merely true for the material background to life, but may be applied with equal justice to the age's attitude towards literature and the written word. Authors of every kind abounded, and the literary man, as a distinct type, is a creation of this epoch. From one end to another of the Mediterranean men were busy expressing themselves in writing ; on the other hand there was no lack of readers, since education was more widely if more thinly spread than in earlier periods. Further the mechanical production of

^ A. Rostagni, Poeti JUssandrini, 191 6.

"books " had been rendered easierand cheaper by the opening up of Egypt and its inexhaustible supply of papyrus to Greek industry and commercial enterprise.

Yet of all this literary activity there have survived down to our own day comparatively few examples. Prose has suffered much more than verse. Of the latter or at least of the most important school of it — Alexandrian Poetry — we have a reasonably large and representative amount, but the prose literature has perished almost entirely. There survives, it is true, a good deal of Hellenistic philosophy and we still have much of the historian Polybius, but a consideration of these seems to be the concern of the lectures that follow — and in any case Polybius belongs rather to the Roman than to the Hellenistic period of Greek History. Deduct Polybius and the philosophers, deduct a few technical or semi-technical writers such as Euclid, and

there is left nothing but an inventory of prose-writers whose names may be found in the compilations of Susemihl and Christ but of whose works nothing or only the scantiest fragments still survive. It is a somewhat ironic stroke of fate that the generations which preserved and handed on to future ages the literary works of Classical Greece should have been unable to ensure the survival of their own writings, especially when those writings were to be numbered by thousands. But the reason for this disappearance of Hellenistic prose-literature is not far to seek.

During the first century of our era there was consummated a movement which had begun about the second half of the second century b.c. The Greeks

HA t

definitely turned their backs on the literature of the Hellenistic age and demanded that in future writers should conform to Attic or what they deemed Attic canons. This Renaissance^ as it is sometimes called, was retrospective as well as prospective ; that is to say, not only did it lay down rules for the future, but it also applied these rules to the writers of the past and deliberately neglected those who offended against them. Such a standpoint was fatal to the survival of the Hellenistic prose-writers, for almost without exception these men were either careless of the form in which their thoughts were expressed or at the least quite unskilled in the graces and subtleties of the Attic style as understood by the Neo-Atticists. To take two outstanding instances, Epicurus' indifference to elegance of language is notorious and much of Polybius reads like modern journalese. It is true that the Hellenistic age produced its own characteristic prose-style, the so-called Asiatic, but the attempts in this direction were half-hearted and in any case not unnaturally condemned by the later reformers.

These deficiencies of Hellenistic prose- writers are to be explained on various grounds. To begin with, Greek — the Greek of the KOLvy)hiaK€KTos — was now being written by many persons of non-Hellenic or at least mixed descent. The Semitic origin of several prominent Stoic philosophers has often been noted. Again the vocabulary of educated men had become

enormously more technical. Someone has said that Plato had been able to construct a system without using more than one technical word. If we turn to Epicurus and the Stoics, we find that a whole vocabulary of technical terms must be learnt by

heart before their writings become intelligible. It is true, no doubt, that in some ways an increase in technical terms marks an advance in thought (if it were not so, the twentieth century might well despair of itself!), but the habit among these writers goes far beyond what is necessary. Simple verbs are abandoned for compounds without any gain in expressiveness ; abstract terms are found everywhere, and so on. After a short experience of writing, such as we find for instance in Polybius, we begin, I will not say to approve, but at least to understand, the reaction of the Atticists.

As a result of that reaction the bulk of Hellenistic prose has been lost to us : some books have survived because of their value for the specialist, many have been absorbed into later encyclopaedias and general histories, but many more must have simply perished. The loss is more important for the historian and scientist than for the student of literature, for, while it is extremely improbable that we have to regret the disappearance of any literary masterpiece, our knowledge of Greek History would be considerably increased, if we possessed — for instance — the Memoirs of Aratus of Sicyon, or Timaeus' monumental work on Sicily and Magna Graecia, or even Dicaearchus' account of Greek Civilization, entitled Bto5 ∗EXXa8os.

Again much scientific and learned writing which would have been instructive and interesting has no doubt perished. As classical scholars we must desiderate with especial regret the works of Aristarchus and the other Alexandrian grammarians who devoted their lives to the elucidation of the Classics. It is, of course, true that fragments of their teaching

remain imbedded in later Greek treatises — more particularly scholia — and from these modern scholarship has been able to reconstruct the main outlines,

but many points must be left unsettled and nothing can replace the loss of the originals.

With this qualified tribute to the works which have perished we may leave the subject and turn now to the consideration of what actually survives. In this by far the most conspicuous element is represented by the writings which are known under the title of "Alexandrian Poetry" — owing to the relations which connected their authors with the Court, Library and Museum established by the Ptolemaic dynasty at Alexandria. The term is a convenient one and rightly calls attention to circumstances which certainly exerted great influence on many of these writers, but it must not be stretched to cover all the poetic output of the Hellenistic age. Recent discoveries of papyri have revealed to us the existence of a popular satiric and moralizing poetry which — in spirit at least — is quite alien from the products of the Alexandrians. Along with the two types just mentioned we shall do well to take into account what may be called the popular amusement-literature of the age, a mass of writing for which it is hard to find a comprehensive name but which may be loosely denominated as The Mime and its by-products.

As in the case of the popular moralizing poetry » so in the case of the Mime our knowledge has been (widely extended by the discoveries of papyri. This is not the place to dwell at length on the great services rendered by papyrology towards the illustration of the Hellenistic age, but the essential

thing to remember is that before the advent of that science (and incidentally of the thorough investigation into the literary tradition which it has stimulated) our chief difficulty had been that we could not see below the surface. The history of the period, apart of course from Polybius, had to be gathered chiefly from late epitomes, and was then only a bare narrative of events. Now, thanks to the papyri, a great part of the legal and administrative system of Ptolemaic Egypt is laid before our eyes. In religion, again, though it has been said that the Hellenistic age was the least religious in the history of the ancient world and though it is certainly true that a rationalism inherited from Ionia was its chief characteristic,

nevertheless it is gradually becoming plain that we must not take the enthusiastic Pantheism of the philosopher nor the refined scepticism of the cultured poet as the faith of the average man. The researches of Reitzenstein and others show us ^ that the mystic Oriental cults which become so important under the Roman Empire were already ' in high favour with the populace. No doubt the ' ideas connected with these cults did not emerge into the higher branches of literature till the first , century b.c, when Poseidonius made them familiar; to Greeks and Romans alike, but their influence was felt long before.

The causes which have thus transformed our views of Hellenistic government and religion have not failed to aff^ect literary criticism : the lower strata of Hellenistic literature begin to claim re- cognition, and among these we can, as I have said above, not unreasonably distinguish two tendencies

— one represented by the moralizing poetry and one by the Mime.

Before we consider our three types of literature separately, it will not be amiss to say a word or two in explanation of their appearance at this juncture and regarding their inter-relations. When the Greek world began to settle down again after the conquests of Alexander,, it certainly became necessary to create new types of literature, but we should err greatly if we supposed that the old fell into oblivion. While educated men had their libraries, public and private, the masses had their ayoive^^ i.e. public contests or competitions. The ayoiv^ athletic or musical, had been one of the most important elements in the culture of classical Greece: among musical dywi/es the most famous of course were the dramatic contests at Athens. As early as the end of the fifth century the Attic Dionysia were imitated in the islands and in Asia Minor. After the Macedonian conquests the institution spread far and wide over the newly-acquired terri- tories. It is characteristic of the age that the athletic contests, now largely professionalized, were less popular than the musical. These latter might be either cr/oyvt/cot or ^i>/xe\t/cot, according as the performers appeared on the stage {cncrfvyj) or in the orchestra {OvfxeXr)) : tragedies and comedies

were played on the stage, while the other competitors, e.g. reciters of epic, panegyrists, musicians, etc., appeared in the orchestra. At the numerous new festivals, founded by the successors of Alexander in competition with the games of classical Greece, there were always dywves of some kind, and it was customary to produce at them not only

modern specimens of tragedy, comedy, epic, etc., but also works by the classic writers. The business of production and acting was managed by the so-called "Dionysiac artists," troupes of professional players who were either permanently established in one city (Ptolemais, Rhegium, Syracuse, apart from many cities in Old Greece, are cases in point) or else wandered round from one town to another. It is plain that in this way even the masses were still kept familiar with the ancient Epic and Drama. But when all this is admitted we must not take Theocritus' ironic *AXt9 Travrecrcnv "Ofji-qpo^^ as anything but the retort of a patron to an importunate poet. If educated men, as represented by the Alexandrians, were not content with their inheritance, neither were the cosmopolitan inhabitants ofthe new royal towns — "the Macedonians who had degenerated into Syrians, Parthians, and Egyptians" as Livy scornfully styles them. Both classes were thrown back on their own resources with the result that the cultured took refuge in "art for art's sake," in the pursuit of curious learning — and in the cultivation of a mild sentiment for romance. On the other hand the lower classes consoled themselves with the farcical and humorous, and with the frankly sensual — features which one or other of the various types of Mime was able to supply. The moralizing poetry and prose ofthe Hellenistic age come in as a kind of counter-blast to the two tendencies just indicated. They are directed equally against the superficiality of the erudite poet and the sensuality of the proletariat — more perhaps against the former than against the latter, for they

^ Theocr. xvi, 1. 20.

are closely connected with the Cynic philosophy, and the Cynics were always more charitable to primitive than to civilized vice. Ethical considera-

tions of this kind are unknown both to the Alexandrian Poetry and to the Mime. Eratosthenes, a fair representative of the Alexandrian school — though he was more savant than poet — objected to moral criticism of Homer, and Alexandrian Poetry as a whole — with the possible exception of Aratus — disclaimed any moral or religious mission. It was the same naturally enough with the Mime. But while the latter on this point ranges itself with the learned poetry in opposition to the moralists, in one feature, viz. its realism, it quits the Alexandrians and joins the other side. For while the learned poets, owing to their taste for genre treatment, were wont to practise a curious realism in details, their general tone, on account of their subject-matter and almost as it were in spite of themselves, was distinctly romantic and idyllic. The Mime on the other hand was naturally dominated by a realistic spirit, while as for the moralists one has only to read Diogenes Laertius' Lives of the Cynic Philosophers to learn that few people have believed more firmly than they in calling a spade a spade.

It is amusing to observe the very different handling of the same theme by the Alexandrians on the one hand and the mime-writers or moralists on the other. Two instances will show what I mean. To take the first. Diogenes Laertius in his Lives has recorded many scandalous details about the private life of the various early philosophers. This "information" or much of it has been traced to an

anonymous book, entitled 'ApLcrTnrTros Trepl TraXatas Tpv(f>rj<;, which was apparently written between 250 and 200 B.C. The author was a Hedonist of some sort or other and his object was to show that the principles which he advocated had actually been put into practice by the founders of philosophy. The pseudonym Aristippus was no doubt chosen with reference to the founder of the Cyrenaic school of Hedonism, Many of the stories which this pseudo-Aristippus records can be traced back beyond him, and against his treatment of them we may set that of an Alexandrian poet, Hermesianax of Colophon, who lived one or two generations

earlier. Athenaeus has preserved a long fragment from the third Book of Hermesianax' Leontion^ a curious work in which the poet set out to teach his mistress, after whom the poem is called, that all the great men of the past had felt the force of love. Towards the end of the fragment Hermesianax catalogues thelove-affairs of the philosophers. Pythagoras, Socrates, and Aristippus are mentioned, and though, as poetry, the passage is distinctly feeble stuff, there is a certain air of tender melancholy about it which some modern critics appear to have found attractive.

The lines on Socrates and Aristippus run as follows :

And you know with what mighty fire wrathful Cypris melted the heart of the sage proclaimed by Apollo to be the foremost of mankind in wisdom — even Socrates, and how going constantly to the dwelling of Aspasia he relieved his profound mind of pain and lightened his burden, nor yet could he find any remedy, though he had found many a path through argument. Desire too it was that

drew the man of Cyrene to cross the Isthmus what time keen-minded Aristippus fell in love with Lais and fled from all converse with his fellows....

Comparing Hermesianax with the author of the Trepl TTokaias Tpv(f>rj<sWQ see the gulf which separates the two.

Another example of different handling of the same theme comes to light in regard to the Assyrian monarch Ninus, who in the verses of the moralizing poet, Phoenix of Colophon, figures as the type of the dissolute tyrant, but in an early prose romance found in Egypt appears as a manly hero and the honourable lover of a modest princess.

So much for the general tendencies and interrelations of our three types of literature. It is time that we turned to consider them separately.

Of the Alexandrian poetry there have come down to us in the ordinary way the Hymns of Callimachus — the Argonautica of ApoUonius Rhodius — Theocritus— three didactic poems (one by Aratus and two by Nicander) — the Alexandra of Lycophron —

and a considerable number of epigrams by these and other writers. Under the circumstances this is much, though the selection contains no real specimen of the Alexandrians' most important and characteristic composition — the narrative elegy.

The Attic Renaissance interfered but little with the preservation of Alexandrian poetry: the archaizing tendencies of the latter appealed to the Stylists, while its obscure allusions and difficult vocabulary commended it to the professional scholars, the TratSes ypajxixaTiKoiv as Clement of Alexandria calls them. That we possess no more of it to-day seems to be due to accident, for some.

works such as the Aitia and Hecale of Callimachus can be traced right down to late in the Byzantine period.

As a result of this survival through the Roman and early Byzantine ages we have, in addition to the complete works catalogued above, a very large number of fragments cited from Alexandrian poets by grammarians and others. Unfortunately only a very few, like that of Hermesianax quoted earlier, are long enough to be appreciated. To this inheritance transmitted by the usual channels the discovery of papyri has added Herodas and a good deal of Callimachus' works other than the Hymns and EpigramSy including a portion of his Aitia which is of great importance for a just appreciation of Alexandrian achievement and its limitations.

That achievement is too often said to lie exclusively in its attention to and mastery of poetic form. This defect of criticism seems to be due to the fact that these poets have usually been considered chiefly in relation to their Roman imitators, and that in this connexion it is certainly correct to emphasize the formal importance of the school. But this accident ought not to blind us to the real nature of the facts : if we look beyond the Romans , to certain productions of Greek literature under the Empire, to Nonnus and his school, to the Greek novelists, to the letter-writers, Alciphron . and Aristaenetus, or even if we examine a little more closely the short epics {epyllid) of the Roman vecorepoL (Catullus, Cinna and the rest), it becomes plain that the Alexandrians, besides being masters

of form, were also very important innovators in poetic material.

I do not refer here to the "didactic" poetry of Aratus and Nicander, nor to the thousand and one odd subjects, which an enterprising age clothed in metrical form. Many of these "didactic" writers are simple metaphrasts, that is to say, they do nothing but take a prose treatise and turn it into verse. It was in this way that Aratus versified the astronomical treatise of Eudoxus and Theophrastus' remarks on weather-signs ; similarly Nicander in his Alexipharmaka and Theriaca is versifying the prose-writings of one ApoUodorus — on "Antidotes to Poisons" and "Snake-Bites" respectively. The works of Nicander are but little mentioned in antiquity, but the popularity of Aratus is one of the puzzles of literary history. Astronomy is no doubt a fitting subject for poetry, if adequately treated, but Aratus makes no attempt to soar. A mild Stoicism pervades the poem, but it may be doubted whether this fact explains the appeal which Aratus made both to Greeks and Romans. The only thing which to-day really merits our admiration in these poets is their ingenuity in putting technical terms into verse. This ingenuity is greater in Aratus than in Nicander, for it is more difficult to suggest in verse the shape of an isosceles triangle than to depict in the same medium the results of drinking white lead.

Again when I speak of innovation in poetic material I do not even refer to the Pastorals of Theocritus and his imitators. These of course have exerted a very great influence on succeeding literature, but they do not reveal, except incidentally, the essence of Alexandrian Poetry. This must be sought rather in its relation to and treatment of mythology.

POETIC INNOVATION 4^

Ever since the dawn of Greek history the mythology of the epic cycle had supplied the material for nearly all Greek poetry — epic, lyric, and tragic. But times were now changed, and amid the literary war-cries which issue from the school of Callimachus, we find expressions of

dislike and contempt for those poets who still pursue the beaten track. That this opposition to the so-called "cyclic" writers was not directed merely against their unimaginative repetition of Homeric phraseology seems to follow from passages where Callimachus reveals his distaste for the matter of the epic cycle. But, if the heroic mythology was to be regarded as exhausted for poetic purposes, to what could the poet turn.'' Sheer invention was unnatural to the Greek turn of mind ; nor was the choice of a strictly historical theme looked upon with much favour, since it limited the poet's freedom. Hellenistic monarchs sometimes maintained court poets, whose duty it was to sing their patrons' achievements — one such was the epic poet Simonides of Magnesia, who celebrated the victories of Antiochus Soter — but though, if we may judge them by the official panegyrics of Theocritus and Callimachus, these poets wrote with more grace and less servility than the Roman eulogists of the Caesars, their reputation was not great.

Nevertheless, though no inspired writer appeared able to fashion current history into a great epic, the historical had much interest for these Epigoni, and in their search for new poetic material they tried to combine something of the old mythology with the history or pseudo-history fashionable in

their own age. It must not be supposed that this fusion was due to the Alexandrians: we should always remember Callimachus' words of warning — dfidpTvpov ovhkv deCBo). As a matter of fact the material lay there before them, with the mythological and historical elements already combined, but waiting to be touched into poetry. It was to be found in the Local Legends, the myths, that is, explanatory of local custom and ritual which, scarcely touched by the Homeric influence and Athenian tradition, still survived in the places which had given them birth.

In Asia Minor and more especially in Ionia these

' myths were still vivid in the minds of the people or carefully treasured in the city annals. Ionian influence on Hellenistic civilization has long been recognized : exactly then as the Ionian dialect

influenced the Kouvrj StaXc/crog so the spirit of Ionian literature aff'ected the tendency of Alexandrian Poetry. For these tales and local legends

1 were selected by the Alexandrians as material for

I poetry, and in this selection lies perhaps the

! greatest importance of the school.

The famous quarrel between Apollonius and Callimachus has tended to give undue prominence to the Callimachean ideal of polished brevity, and to make modern critics, as perhaps also contemporaries, almost forget that, though their temperaments were very difi^erent and though in consequence the spirit which colours their writings is dissimilar, yet in one respect Apollonius and Callimachus were in agreement. If not altogether in his Argonauticay at least in his other poems Apollonius like Callimachus turned from the highway of Homeric

saga to the themes of local history and mythology. The other poets of the age did likewise.

The greater number of these stories are narratives of unhappy love, either between two mortals, or between a mortal and a god or goddess. Many of the latter kind are attached to a locality by the "metamorphosis" idea, i.e. the belief that some stream or rock or what-not in the neighbourhood really represents the shape assumed by a maiden fleeing from the amorous god, and so on. In the former class a favourite theme is the princess in the besieged city, who betrays her folk to the enemy out of love for the commander of the besieging army: the Italian story of Tarpeia, the subject of an elegy by Propertius, the Roman Callimachus, is perhaps the most famous of all tales of this description. No doubt in many of these stories there is a nucleus of historical fact, but in course of time the particular has been obscured by the typical.

Our chief source for these tales is the mythological handbook of Parthenius. Parthenius was a Greek of Nicaea in Asia Minor who was brought captive to Rome somewhere about 75-70 b.c. and became instructor of the poets (Calvus, Catullus, Cinna and the rest) who were attempting to build

up stricter canons of style by a close study of Alexandrian poetry. Parthenius himself has been called, not without reason, " the last of the Alex-andrians." He was also the teacher of Virgil, and it was for Virgil's friend, the poet and politician Cornelius Gallus, as he tells us in the preface, that he put together this collection of love-stories, for that is what his book calls itself — 'Epcon/ca UaOiJixaTa. Gallus was to use the stories as the material for his

epic and elegiac poems, and here we may be sure that Parthenius is recommending the practice of the Alexandrians.

In the single MS. of the ∗EpQ)TLKa UaOijixaTay attached to most of the tales, is a brief list giving the names of authors who have recorded them. These lists, it has been proved, do not always give the sources used by Parthenius himself, but they are generally regarded as trustworthy and as the work of some accurate and widely-read scholar of comparatively early date. A perusal of them is instructive : along with the names of Alexandrian poets such as Apollonius and Euphorion, we find frequent mention of local historians, e.g. Aristocritus in his History of SamoSy Aristotle and the Historians of Miletus^ and so on. Besides Miletus and Ephesus other districts which seem to have been fertile in such legends are Bithynia, Pallene, and the islands of the Aegean.

Before the Hellenistic epoch not many poets, so far as we can see, had exploited the material contained in these legends. Stesichorus, the early Sicilian poet, was perhaps the first to introduce the theme into literature, but his Kalyke and Rhadina found no immediate successors. The Athenian tradition was unfavourable to the motive, though here, as in so much else, Euripides foreshadows the taste of later generations. Ovid, it is true, can write of Tragedy

haec quoque materiam semper amoris habet∗,

but that was much later, when Alexandrian in-fluence had affected even drama. It is more to the

^ Tnst. II, 1. 382.

point perhaps to observe the changed attitude which historians later than the Attic age adopt towards these legends. Thucydides had made but a passing and contemptuous reference to the story of Tereus, Procne, and Philomela : on the other hand writers like Timaeus and Phylarchus seem, to judge by the fragments, to have been at great pains to develop any episode of this kind which crossed their path.

The way was thus paved for the Alexandrians, and to some extent their choice of material must have been influenced by contemporary taste, but two particular reasons may be adduced to explain that choice. The first is simply their position as writers attached to an establishment of learning, the Museum at Alexandria. Being as much scholars as poets they turned very naturally to ^evau /cat drpLiTTot, la-Topiai^such. as the locallegends. Further a more immediate influence was probably exerted — at least upon the earlier Alexandrians — by Demetrius of Phalerum. Whatever the part played by this person in the foundation of the great Library at Alexandria, it is certain that during the earlier period of Alexandrian Poetry the Peripatetic school was the leading school of philosophy in the Egyptian capital, a fact that is plausibly attributed to the influence of Demetrius. But not only had Aristotle and his successors shown more ardour than the other schools in investigating the psychology of love, they had also distinguished themselves by their researches into local history and con-stitutions. Studies like these must have brought to light plenty of poetic material, for in nine

^ Artemidorus, Oneirocr., iv, 63.

cases out of ten the overthrow of a Tvpavvis was connected with some episode of passionate love.

The second reason which accounts for the treat-ment of these stories by the Alexandrians is the re-juvenescence of local patriotism. This phrase may seem paradoxical in view of the tendency to cosmo-

politanism which admittedly marks the Hellenistic age, but by "local patriotism" in this context is to be understood not a living faith in a country's present, but a sentimental enthusiasm for its past — in other words just such a feeling as produced so many local chronicles of the 'Ar^tSe? type about this very time.

Some cities had no title to fame except in their legendary associations. Thus both Strabo and Mela tell us that Sestos and Abydos contain nothing of interest except the tower of Hero and the story of Hero and Leander, and in the same connexion it has sometimes been suspected that the late Greek poem by Musaeus on this subject is based on an earlier Hellenistic original, which made the tower and its obscure origin the starting-point of the] narrative. Ancient cities such as those just men-j tioned were alive to the material advantages which] the glories of their past might procure for them ;j they seem to have run a Publicity Department and! we get a glimpse of its methods when we read in-| scriptions which mention the rewards given to poets] for singing the past of this or that city. These] complimentary poems were known as eyKWfxia eVtKa,] and were generally recited at the ayayve^ ^v/>t€\t/cot.j In many cases we find the services of a distinguishec writer employed for this purpose, and poems whicl

I

narrated the foundation (/crto-t?) of cities became a recognized branch of Alexandrian art. ApoUonius for example wrote /crtcrets of Rhodes, Caunus, Alexandria, and Naucratis besides a poem called Campus. When we reflect that ApoUonius, who was almost certainly a native of Alexandria, subsequently received the citizenship of Rhodes and perhaps of Naucratis, we begin to understand that these poems were not written in the air. There were practical reasons which tended to draw the interest of the Alexandrians to local legend.

In what ways did they handle their material } The departments of Classical Greek Poetry may be put at five, viz. epic, lyric, elegiac, tragic, and comic. Hellenistic Comedy had best be considered with the Mime and of the remaining four two need not detain

us long, for lyric was practically dead and tragedy was in not much better plight.

In the first half of the third century B.C. certain Tragic poets were known as the Pleiad^ and seem to have enjoyed considerable fame among their contemporaries. We can form but little idea of their achievement. One member of the Pleiad –w^is Sositheus, who is praised by a writer in the Anthology for having revived the ancient coarseness of the Satyric Drama – a doubtful compliment. Another was Lycophron, the only Hellenistic tragedian of whom we possess a complete drama. This extraordinary monologue-play – the Alexandra – can scarcely be representative of contemporary tragedy nor perhaps is it typical of Lycophron himself, for that he could write lighter verse, when he chose, is shown by the fragments of his Satyric drama, in which he pokes fun at the philosopher Menedemus

4–*

and the coterie of intellectuals at Eretria, among whom the author had spent his youth. His versification in the Alexandra of obscure mythology, , which is mostly taken from the geographer and ^ historian Timaeus, accords with Alexandrian principles, but Lycophron lacks the qualities by which such poets as Callimachus redeemed their works from dulness.

Lyric, we have said, was practically extinct. Songs j continued to be written for public festivals and ^ processions, and both Callimachus and Theocritus attempted lyric measures, but in Alexandrian poetry these are exceptions. Poetry was now written, if not for reading, at least for recitation, so that it came to be composed almost exclusively in the three metres which adapt themselves to recitation – the hexameter, the elegiac and the iambus. It is significant that Theocritus modernizes Pindar and Stesichorus by rewriting their lyric compositions in hexameters. Iambic metres – especially the scazon or choliambic verse – were frequently employed in the Hellenistic age, both by the Cynics and others, as we shall see, for moralizing poetry and by the Alexandrians for informal miscellaneous writing, mildly satirical, such as we get in Callimachus'

lambiy of which work a largish fragment has been discovered among the papyri from Oxyrhynchus.

But the two metres chiefly favoured by the Alexandrians were the hexameter and the elegiac. The hexameter was used for epic compositions such as the Argonautica^ for the shorter works called CTTuXXia, for the pastoral, for hymns, and many other subjects. The elegiac could also be adapted to hymns, but was chiefly employed for narrative elegy

LOVE AND LOCAL LEGENDS $2

and every kind of epigram. The material derived from local legends seems to have been usually treated in either cTrvXXta or narrative elegies. Of a real Hellenistic invkXiov we possess no satisfactory example, but we can form some idea of the genus by separating the third Bookof ApoUonius' Argonautica in which he describes the love of Jason and Medea, from the rest of the poem, or again by reference to Roman imitations such as Catullus' Peleus and Thetis^ the Ciris, or Book IV of the Aeneid. As regards narrative elegy it is true that we possess no complete specimen even of this, but we have considerable remains of the Apollo by Alexander Aetolus, the Leontion by Hermesianax, the Erotes by Phanocles, and the Aitia by Callimachus. Compared with the imitations of the Romans and later Greeks these remains enable us to judge with some confidence of Alexandrian achievement in this branch.

Our point about the importance of the local legends has been that their exploitation by the poets meant the introduction to Greek Poetry of romantic and erotic motives which had not hitherto been given adequate presentment. Unfortunately most of the Alexandrians were prevented alike by temperament and environment from making the most of the opportunity which offered itself. It is perhaps possible here to make a distinction between the first and second generation. Some of the former, though in style they are genuine Alexandrians, wrote before the full effect of the close connexion established between poetry and learning at Alexandria had made itself felt. Philetas and Hermesianax, following in the steps of Antimachus of Colophon, who lived a generation or so before them, seem to have kept

their narrative love-poems fairly clear of irrelevant learning, but in the later Alexandrians the romantic interest is made subordinate to the aetiological.

The fragment of Callimachus' Aitia discovered at Oxyrhynchus is very instructive on this point. By a rare stroke of good fortune it contains part of the most celebrated episode in the whole work, the love-story of Acontius of Ceos and Cydippe of Naxos. The tale is well known from Ovid's Heroides* and other sources, how Acontius by a ruse obtained from Cydippe an oath that she would marry him, how her parents in ignorance tried to wed her to another, with the result that Cydippe invariably fell ill on the eve of the marriage, how eventually Apollo at Delphi enlightened Cydippe's father and all ended happily. Callimachus' handling of this story in the Aitia had been largely reconstructed, before the discovery of the new fragment, from the adaptation in the late Greek letter-writer Aristaenetus. When compared with the latter, the fragment from Oxyrhynchus shows how Aristaenetus with his rhetorical training has infused into the narrative a pathos which is notably absent from the original. It now appears that Callimachus merely happened upon the story when he was putting into elegiacs the prose chronicle of Ceos compiled by one Xenomedes. He tells us this in so many words himself, and he records the chequered career of Acontius and Cydippe with no more enthusiasm than that which he devotes to various points of early Cean history that are treated immediately afterwards. The poetry is brilliantly superficial : Callimachus makes no attempt to analyze the sentiments of the ,

* Ov. Heroides, xx.

two lovers or to do anything but record the facts. In short there is a complete absence of humanity.

In view of this it is disconcerting to find that the ancient world seems to have regarded Callimachus' presentment of this tale as the ideal love-story. We are left wondering, but we may note this. Some of its popularity may have been due to its happy ending. Most Alexandrian love-stories — see Parthenius passim — concluded in much more tragic fashion : the metamorphosis motive in particular rarely permitted a happy ending. In his tale of

Acontius and Cydippe Callimachus hit the popular taste and it was this type of story — i.e. of two lovers first kept apart by all manner of difficulties, but afterwards united — which eventually won the day and centuries later inspired the Greek Novelists. Only a small part of the credit for all this is due to Callimachus and his fellows : they had stumbled almost by accident on first-rate poetic material, but they had bungled in their use of it. The plain fact is that the Alexandrians had little heart, and all the cleverness in the world could not compensate for this deficiency.

The exception proves the rule. For ApoUonius of Rhodes whose portrayal of Medea in his Argonautica is the greatest piece of character-drawing in Alexandrian poetry, was reckoned a heretic by his contemporaries and it has been shrewdly suspected that it was this revelation of humanity and a genuinely romantic spirit — and not some academic difference of opinion concerning the merits of long and short poems — which really brought about his quarrel with Callimachus.

In this connexion it is extremely difficult to ex-

plain why the Roman elegists so constantly refer to the Alexandrians — especially Philetas and Callimachus — as their masters in the art of amatory poetry. The love-elegy as we find it in TibuUus, Propertius, and Ovid seems to have little connexion with narrative poems such as the j^itia. It has therefore been argued that Philetas and Callimachus at least wrote not only narrative elegies in which stories like that of Cydippe found a place, but also subjective erotic elegies in which they described their own affairs of the heart much in the manner of the Roman poets. The alternative theory is that the Latin subjective elegy dealing with love was a more or less original product, a development and enlargement of the Greek amatory epigram. The problem remains and must remain undecided, but it is certainly true that what genuine feeling and passion the Alexandrians possessed they seem to have reserved for their epigrams. There is nothing in the more ambitious works of Callimachus which from this point of view can equal the famous memorial verses on his dead friend Heraclitus.

The Greek epigram has a long history before the Hellenistic age, but it was the Alexandrians who fashioned it into an instrument marvellously adapted to convey their comment on every aspect of the life that surrounded them. Of the extant Hellenistic epigrams the greater number are amatory, and these, though they already employ all the conventional machinery of artificial love-poetry, e.g. the boy Eros, his arrows, and the rest of the paraphernalia, nevertheless, at least in the hands of poets who stand rather outside the Museum circle, such as Asclepiades of Samos, still exhibit a

genuineness of feeling which under the circumstances is perhaps surprising.

Our two remaining types of Hellenistic writing, the amusement-literature and the moralizing poetry, may and must be treated more briefly. Both exhibit popular elements which are absent from the works of the Alexandrians. Their appeal was primarily to the masses and in the case of the amusement-literature this appeal was made not through books — the day of cheap novels and the comic press had not yet dawned — but through the spoken word of public performances.

The same thing is, of course, true for Athens of the fifth and fourth centuries, but Athenian tragedy and comedy, the vehicles of popular education and amusement in those centuries, were ill-adapted to serve the same purpose in the Hellenistic age. Tragedy, as we have seen, continued to be performed, but it can scarcely have appealed to the crowd. The same remark applies even more to comedy. The art of Aristophanes could convey little meaning to a subject of the Ptolemies and even the New Comedy with all its cosmopolitanism was only at home in the academic and rather supercilious Athens of Hellenistic days. It is true that the Ptolemies made some attempt to persuade the leading writers of the New Comedy to desert Athens for Alexandria, but Menander refused the invitation and even Philemon, who accepted, stayed only a short time. It is obvious that the atmosphere was uncongenial. There is however one exception and that not without significance. Machon, a native of the Peloponnese and the author of comedies, is expressly said by Athenaeus to have resided in

Alexandria and to have exhibited his plays there. These have not survived : but from another work of the same man, viz. a witty but somewhat ob- scene collection of anecdotes relating to hetairaiy Athenaeus has preserved for us considerable ex- tracts. Compare these with the writings of Men- i ander and the other authors of the New Comedy, who are careful to preserve at least a semblance of respectability, and the difference between Athenian) and Alexandrian taste is revealed.

The inclination of the masses in the Hellenistic age was towards realism, to a close study and re- presentation of the life which surrounded them, a life which, owing to increased luxury and the mingling of nationalities, had become more sensual I than that of their predecessors, and this inclination found satisfaction in the Mime, which according to the definition of an ancient grammarian is " an imitation of life embracing both what is proper and what is improper."

Certainly in this period and probably afterwards

there were two kinds of Mime, one spoken and

one sung — the actors being called yutijaoXoyot and

fttjLtwSot respectively. The two varieties probably

originated in different parts of the ancient world,

the spoken Mime being a native of the Doric West,

and the Mime which was sung of the Ionian East.

There are obvious resemblances between the culture

and civilization of Magna Graecia and Ionia on the

one hand and of the monarchies of the Diadochoi

on the other. In the earlier period there are great

. cities, e.g. Syracuse, Miletus, Ephesus, which an-

\ ticipate the various capitals of the Hellenistic age,

I and life in these cities was almost as complex and

luxurious. It was therefore natural that a type of art, [which seems to have arisen amidst this early city-civilization, and then to have suffered temporary eclipse during the age of Athenian supremacy, should regain its popularity when the former conditions of life were largely reproduced.

The spoken Mime, then, originated in Magna Graecia, being probably a development of one of the forms of "Dorian Comedy" imported from the Peloponnese. Such a development would not have been difficult, for there is evidence that even in the Peloponnese "Dorian Comedy" could eschew mythological travesty and its phantastic elements and concentrate on the realistic portrayal of life. Athenaeus, at least, tells us of a dramatic entertainment at Sparta called the Deikelon in which the actor represented (e/xtjaetro) such different characters as a fruit-thief and a foreign doctor. Apart from the literary Mimes of Theocritus and Herodas the only specimen of a spoken Mime which has survived belongs to a considerably later period, but there is plenty of evidence for the popularity which these works enjoyed in the Hellenistic age.

Even as early as the fifth century b.c. Syracusan performers began to wander East, exhibiting their skill in the mimic art. But it was only about the beginning of the third century b.c. that, thanks no ^ doubt to the increasing unity of Mediterranean civilization, the actors of mimes became as regular a feature of the Greek world as the other travelling players. Production was apparently in the hands of the vague class known as davfiaTOTTOLOi, and the ordinary troupe probably included no more than three or four persons. Of these practically all ex-

cept the d/o)(t/>tt/Aos were of negligible importance, for the Mime was essentially a one-actor affair. To begin with, no doubt, this was literally true, but later the original actor took in certain complementary persons as the occasion required — e.g. if the ap^t/Atjotos were acting the part of a doctor he

would require a patient and so on — but he always contrived to retain all the threads of the action in his own hand. The importance of these " actor-managers " is well illustrated by the epitaphs of archimimi — and by those of arc/iimimae, for — another advance in realism — women appeared in the mimes no less than men, in fact, to judge by the remains, even more frequently. Thus it would appear that by the third century b.c. the Mime had obtained an adequate class of players, though naturally the less ambitious nature of their plays and perhaps the inclusion of actresses — no doubt women of ambiguous morals — caused the Dionysiac artists to regard them with suspicion. From forming a mere side-show to the displays of Tragedy, Comedy, etc. they gradually pushed their way into the official programme at games and other festivals. As early as 270 B.C. a davfxaToiroLos Cleopatra is mentioned in an inscription of Delos among other prize-winners, and from this date onward /Ltt/xoXoyot, yStoXoyot, rjOoXoyoL (all names denoting the actors of spoken Mimes) appear with increasing frequency in this connexion.

So much for the external features of the spoken Mime. What of its content ? Here the task of the literary historian is rendered difficult by the lack of material. We have, as noted above, one Mime from Oxyrhynchus : this papyrus belongs to the second

century A. D. but the compositions which it contains, a Mime and a Farce, are assigned to late Ptolemaic or early Imperial times. We have some hints in Athenaeus, which all tend to show that the subject-matter of the Mime was taken from low life, and lastly we may within limits argue as to the nature of the popular Mime from the literary type com-posed by Sophron, Theocritus, and Herodas.

The theme of the Mime from Oxyrhynchus is the same as that treated by Herodas in his fifth Mime, to wit a jealous mistress and a slave who refuses to yield to her demands. The details of the action remain obscure and it is probable that the papyrus contains merely the outline of a play jotted down as the basis on which the company could improvise as they pleased. The coincidence with Herodas has been variously interpreted, some thinking that the work from Oxyrhynchus is a

popular adaptation and expansion of the earlier composition, others supposing that both mimes are handling a traditional subject independently.

Of Mimody, i.e. of the Mime which was intended to be sung, we possess more examples than of the spoken Mime. Improvisation was here more difficult and consequently the words of a piece were more likely to be written down from the beginning. Mimody, we have seen, derives from Ionia, and the performers are to some extent degenerate rhapsodists. Thus, while the actors in the spoken Mime probably appeared in everyday costume and without masks, those in the musical Mime wore a long white garment and a golden crown. Festus defines one of the two chief types of the mimode as lascivi etdelicati carminis cantator 3ind no doubt the ordinary

productions of Mimody were of this description, like the " Ionian songs " referred to by Aristophanes and Lucian.

The papyri have preserved several examples of this variety of the Mime. By far the most important is the famous Alexandrian Erotic Fragment. This is not really a fragment at all, but a complete composition which gives the lament of a deserted hetaira who pleads outside her lover's house to be taken back again into his affections. The piece is written for the most part in excited Dochmiacs: the language is the koivtj of the second century B.C., set off with many poetical expressions. There are obvious resemblances between this composition and the second Idyl of Theocritus. Only here we have a vehemence of phrasing and a wild licence of the emotions which are absent from Theocritus.

Another example of Mimody has been found inscribed on the wall of a rock-tomb at Marisa in Palestine. Its contents are a striking confirmation of a passage in Athenaeus^, where he tells us that all Phoenicia was full of the so-called " Locrian " songs, which are, he says, songs with adultery for their theme.

We are told by Aristoxenus* that Mimody was divided into two types — hilarody and magody, the former being a burlesque of Tragedy and the latter of Comedy. If this is correct, the Farce from

Oxyrhynchus mentioned above is a specimen of hilarody, for it is a parody of the story made famous in Tragedy by Euripides' Iphigenia in Tauris. A Greek maiden, Charition, is held captive by Indian barbarians : her brother succeeds in

* XV, 679 B. ' Ath. XIV, 62 1 c.

rescuing her after making the Indians and their king too drunk to follow in pursuit. A realistic feature is that the barbarians are represented as speaking their own language, which has been identified by Orientalists as one of the dialects of Southern India.

Before concluding this section of our subject it seems necessary to say a word about the literary Mimes of Theocritus and Herodas. Both these Alexandrian writers were following in the tracks of Sophron, the father of the literary Mime, who flourished about 450 b.c. and wrote at Syracuse. It is impossible to reconstruct any one Mime of his from the fragments which survive, but the titles, e.g. "The Tunny-fisher," "The Messenger," "The Sempstresses," "Women Spectators at the Isthmian Games," etc. show that Sophron was concerned to depict typical scenes from everyday life. There was no phantastic element such as remained in Athenian Old Comedy, no parody of mythology like that practised by the other great Sicilian, Epicharmus, and revived in the third century by Rhinthon and the various authors of Phlyakes. The Mime in the hands of Sophron was simply an imitation of life. In one respect Sophron stood nearer to the non-literary Mime than his imitators did: he wrote in prose — a "rhythmical prose" it is true, whatever that may mean, but prose for all that. When Theocritus and Herodas composed their Mimes in verse, they were definitely sacrificing one instrument of realism. Of the two Theocritus with his hexameters naturally idealizes more than Herodas with his scazons.

Of Herodas' Mimes we possess seven, with

considerable remains of an eighth. The pieces bear out the definition of the Mime which we cited

earlier, for Mimes i, 2, 5, and 6 all deal with rather unpleasant subjects. But Herodas is never offensive : his art is purely impersonal, and he shows neither anger nor pleasure in regard to his characters. The only subjective note is one of ironical depreciation.

Theocritus has left us three Mimes, viz. Idyl II {T^he Sorceresses), Idyl XIV (The Love of Cynisca), and Idyl XV {The Syracusan JVomen). All three have long been recognized as masterpieces of inspired realism. His Bucolic Idyls have sometimes been classed as Mimes dealing with rustic life, but here Theocritus idealizes far more than in the urban Mimes and deliberately omits much that a more realistic handling of the theme would have been bound to include. Yet it should be noted that his procedure is by no means the same in all the bucolic poems. Least artificial are without doubt Idyls IV and V ; in these the scene is laid in Magna Graecia, and it is a reasonable theory that they represent Theocritus' first essay in the portrayal of rustic life, an essay made early in his residence at Cos before the vivid impressions of a boyhood spent in Sicily and Southern Italy had faded away. Next to these in realism comes Idyl X; the remainder are far more artificial. Either Theocritus generalizes and sublimates his subject as in Idyl I, or he uses the Pastoral as a setting in which to place his friends andcontemporary authors. Idyl VII, the famous Thalusia, is admittedly the best example ofthis so-called "Bucolic Masquerade," but there are in addition other poems where the

intention is the same if less obvious. In Idyl XI, for instance, the picture of the love-sick Polyphemus and the parody of motives dear to the writers of the amatory elegy is surely a satire not so much on contemporary poetry, as is sometimes supposed, but on a fashion or affectation of contemporary life. But Theocritus' satire is always friendly and i good-natured, perhaps because it springs not from any moral earnestness but simply from his strong sense of humour.

The debt of Herodas and of Theocritus in the | urban Mimes to Sophron is hard to estimated 1 Some verbal resemblances are striking, but it is absurd to talk as though Theocritus had done

nothing but modernize the earlier writer. Both he and Herodas used their own eyes and described contemporary life from their own observation.

Our last type of Hellenistic literature — the productions of the moralists and the satirists — has been described above as a kind of counter-blast to the unmoral poetry of the Alexandrians and the immoral pieces of the variety-stage. As might be expected its authors have no connexions with the Court and Museum of Alexandria: satire and moralizing were not appreciated by the Ptolemies, as Sotades drowned by the royal Admiral for his attacks on the private life of Ptolemy II found out to his cost. Most of the moralists spent their lives ■ roaming about the Greek world : if they settled anywhere it was at Athens where the population tolerated them as harmless eccentrics just as it had tolerated Diogenes in the fourth century. Priding themselves — to the point of ostentation — on their
^ Comp. Headlam, Herodas (1922), p. xxv.
HA ?

independence they viewed with contempt the scholars and poets penned up in the Museum of Alexandria — an institution which one of them, Timon of Phlius, described as "the hen-coop of the Muses." The scholars returned the attack, if it be true that it was Eratosthenes who described Bion the Borysthenite — perhaps the most famous among these wandering moralists — ashavingdressed philosophy in avBivd^ the coloured garments of the courtesan, or in other words of having prostituted that noble science. Theocritus with his gibes at the starved and ill-kempt devotees of Pythagorean-ism voices the same dislike. Bion was OeaTpuKo?, i.e. he played to the gallery^, said his critics, and such methods were abhorred by Alexandrianism.

The prose form in which these men usually expressed themselves seems to have been that which it is fashionable nowadays to call the Diatribe^ a type of literary composition which is very variously defined by different scholars. Ordinarily by this term is meant the pagan equivalent of the I) Christian sermon, a popular homily on some familiar theme, delivered by an itinerant philosopher to such audience as he can collect at a street-corner, or in some camp or at a public festival. These

harangues appear to have been marked by certain features of style which would appeal to the mob, e.g. antithesis, personification, metaphors, puns, etc. I suspect that German scholars have attributed to the Diatribe virtues which it usually did not possess: at any rate the moralizings of Teles who is supposed to reproduce Bion — the so-called founder of the Diatribe — are platitudinous to the point of dulness.
* Comp. Tarn, Antigonos GonataSy p. 236, n. 49.

But the prose Diatribe is far too complex a subject to discuss here. We can only consider — and that briefly — the satirical and moralizing works which were composed in verse, or in the medley of prose and verse of which Menippus of Gadara was the chief exponent.

There are perhaps five writers in this department of whom we are able to form a more or less adequate idea. These are Crates of Thebes, Menippus of Gadara, Cercidas of Megalopolis, Phoenix of Colophon, and Timon of Phlius. Of these five the first three professed adherence to the Cynic philosophy, but Phoenix cannot be shown to belong to any school, and Timon was a Sceptic, a follower of Pyrrho.

That the Cynics were the chief representatives [of popular philosophy in the early Hellenistic age | may be admitted, but in recent years there has - been an obvious tendency to exaggerate their importance. Every scrap of moralizing which can be assigned to the third century b.c. is asserted to be of Cynic origin and books are written to prove the all-pervading influence of the Cynic ideas in later literature. It is certainly true that the paradoxes of Antisthenes and Diogenes had become widely known by 300 b.c. and that they affbrded a useful basis for any would-be satirist or preacher. Further the school could still boast many notable representatives in the third century, but the other philosophic systems contributed not a little to the development of the literature which we are con-sidering, and in addition there was a large body of popular moral teaching which owed nothing to philosophy but had been simply handed down

from one generation of ordinary men to another.

The general colour of the Cynic ideas is well known. Marked features of their system are its transvaluation of ordinary values, its criticism of society, its exaltation of the poor and oppressed. Clearly these are ideas of which the satirist and moralist can avail himself without difficulty, and in fact the Hellenistic writers whose inclination was this way did so avail themselves, but they were not all for that reason Cynics.

It may seem strange perhaps that men like Crates and the other writers just mentioned should have employed verse for the exposition of their ideas, but several considerations may be put forward to explain this phenomenon. To begin with, one of the most favoured instruments employed by these men to inculcate their ideas was Parody, and Parody naturally tends to be parody of verse. Again, it was the fashion to regard early Greek poets like Archilochus and especially Hipponax as in some ways the precursors of the popular preacher of the third century, and the scazon metre of the latter was constantly used by Hellenistic moralists, no less than by learned poets such as Callimachus. Lastly, though in some ways it was an age of prose, it was nevertheless a time when the field was free for any kind of poetical experiment, and at such a time it would have been strange if philosophy alone had escaped being put into verse.

Crates of Thebes is an interesting figure, a man of possessions who abandoned them to embrace the life of a wandering philosopher and thus became the first Cynic missionary, for Diogenes, his Master,

seems to have been little more than a notoriety-hunter. Crates on the other hand was inspired with a genuine zeal for conversion, anxious to "labour with men" (in John Woolman's pleasant phrase) for their soul's good, and earning the nickname of OvpeTravoLKTrj*; from his habit of making house-to-house visits. His literary works are like the man himself, simple and homely but possessing a certain straightforward charm. He wrote, it appears, tragedies, iraiyvia (parodies in the hexameter and elegiac metre), and letters. Crates is the first Cynic parodist and set an example which his successors were not slow to follow. One form of parody, the so-called Silloi poems, in which Homeric lines and phrases were employed for the purpose of a more or less personal satire, had already been made famous by Xenophanes in the sixth century and was soon to be revived by Timon. A few lines of Crates which survive show that he too had written such poems. But this Hellenistic Quaker scarcely pos-sessed the qualities which satire of the kind just mentioned seems to demand : he was more at home in quiet parodies of every variety of verse, in which he was able to correct the mistaken standpoint of his originals, or supply a moral if none existed. His most famous effort in this direction was his parody of Homer, entitled Pera {The Wallei)^ in which this outward symbol of the Cynic faith gave its name to a sort of Utopia. Among the fragments the follow-ing two lines are notable for their expression of a sturdy independence :

■^8ovf) dyBpaTToBcoSei dSovXaroc Kol aKvaiTTOC
dddvarov ^aaiXetav eXevOeptav r a^airaxriv.

Menippus of Gadara was a very different person. Of the man himself we know little, amounting to no more than this, that he was the slave of one Baton in Sinope, later became a pupil of the Cynic Metrocles and having amassed a fortune in commerce died a freeman of Thebes. This somewhat drab if re-spectable career forms an odd background to his writings so far as we can reconstruct them. He appears in the handbooks as the creator of the (TirovSoyekoLov type of literature, the mixture that is of the earnest and the jesting, the aim of which is ridentem dicere verum. "A mocker of man's ephemeral existence" Marcus Aurelius calls him ; "A terrifying hound with a treacherous

bite" says Lucian in the passage where he confesses his debt to him.

The works of Menippus are lost, but fortunately he had imitators in plenty both Greek and Roman, among them Varro, Seneca (in his skit on Claudius) and Lucian, and from these writers it is possible to win some idea of the original which they all followed. Lucian is our most helpful source, and for this reason. It would appear that after the Atticist Renaissance Menippus was forgotten by the Greek world till Lucian discovered this discarded jester who was a compatriot of his own and modernized, that is, "Atticized" him to suit the prevailing taste. In two passages Lucian openly admits his debt, but recent research has shown that the later writer's originality was even smaller than was supposed. Many points naturally remain open to doubt, but it does seem possible to reconstruct in outline at least one composition of Menippus — his Ne/cvta. In this work, which was really rather a KaraySao-ts

or Descent into Hell, he described how he visited the Lower World in order to find Teiresias and to ask him which is the best life. Here on earth the philosophers all preach different creeds and Menippus ironically pretends that certainty can only be reached in some such supernatural way as this. He finds the blind seer in the end and receives his answer that the best life is the life rwv tStwrwi/, by which he seems to mean a life exempt from any kind of dogmatism, and the wisest policy TO rrapov ev dicrdai, a response which Menippus might have given himself without the trouble of visiting Hades. But ot course the Teiresias-motive is a mere framework into which is set the vision of what Menippus saw in the underworld. The description of this seems to have fallen into the usual inconsistencies, which are almost inevitable when a writer is dealing with such a theme ; but two motives stand out above the rest, firstly a bitter ridicule of the rich and of despotic rulers, and secondly a parody of the serious works which narrated the Descents into Hell of Orpheus, Heracles, and the rest, and a caricature of all theories which terrified man with pictures of a world beyond the grave.

Menippus seems to have employed many other settings for his caustic satire — banquet scenes, as-

cents into heaven, auctions and so on ; but Lucian's imitations do not allow us to distinguish the original so well as in the case of the Ne^vta. It is clear that Menippus had a marked gift for satire : he spares no man, and though he professes the Cynic creed he has no mercy for others who professed it without sincerity. His main object no doubt was to display his nimble wit : the moral influence of his writings

was a minor consideration, and from this point of view one may compare him with Diogenes rather than with Crates.

Cercidas, our third Cynic moralist, has of course only emerged from obscurity since the publication of a papyrus from Oxyrhynchus which contains substantial fragments of his Meliambi. A successful politician in third century Greece, he was in intimate relations with Aratus of Sicyon during the latter's attempt to combat the communist and revolutionary tendencies brought into existence by the economic crisis of those days. But despite these relations Cercidas professed to belong to the Cynic school and there is evidence in the fragments that he was not blind to the justice of some of the claims put forward by his political opponents. In the longest of these according to the most likely interpretation he first satirizes the habits of the niggard and the spendthrift, then questions the existence of a Divine Providence, and concludes by warning his fellows of the wealthy class that unless they mended their ways and showed more charity to those below them, they would be caught by the full blast of the Social Revolution and compelled to disgorge all that they possessed. Of the remaining fragments one is more autobiographical : in it Cercidas addresses his soul and contrasts his own placid expectation of old age and death with the usual reluctance of men to close their eyes on this world. The other pieces for the most part deal with less pleasing aspects of the Cynic creed, such as their Hedonist conception of Love and so on.

Phoenix of Colophon is another writer rescued from oblivion by the papyrologists. His editor has

made manful efforts to claim him as a Cynic, but it does not appear that he was a whit more affected by Cynic ideas than any man who wrote in that age as a popular philosopher was bound to be. His scazons exhibit some skill in phrasing and a certain effectiveness of vocabulary, but his subject-matter is not of great interest, being for the most part commonplace moralizing on the failings of the rich and the undeserved sufferings of the poor. Still to-day he is the chief representative of what must once have been a considerable body of writing in which standards very different from those of the Alexandrian Poets were applied to Hellenistic life.

A far more interesting figure is Timon of Phlius. Timon was in his philosophy a Sceptic, a follower of Pyrrho of Elis, but he was no ordinary philosopher. Like King Antigonus he possessed but one eye, but unlike the monarch who refused to have his portrait painted till an artist hit upon the brilliant idea of painting him in profile and so invented a fashion, Timon boasted of his own infirmity and was never tired of referring to himself as Cyclops. Born at Phlius he was first a stage-dancer, then a successful sophist practising for long years at Chalcedon, finally a teacher of philosophy living for the most part at Athens and Thebes. His moral character might seem to be impugned by Diogenes Laertius who calls him ^iXoTrdrry? (fond of the bottle), but Wachsmuth in his edition of the Sillographi shows, I think, that the text does Timon an injustice and that the more eulogistic word <l)LXo7roLr)T7]s (a lover of poets) should be substituted. Timon was like the leading Cynics a "character," and Antigonus of Carystos, the bio-

grapher of the philosophers, described him as IBioTrpdyixcov (an independent sort of person). He was quick at observing men's weaknesses, say the records, and an adept at turning them to ridicule. Other stories picture him as the abstracted sage who allows his writings to lie about half-eaten by the mice. To the same trait may have been due his omission (duly noted by Diogenes) to take any breakfast, though Wachsmuth would regard this as asceticism. Timon was a man of considerable learning : his knowledge of Homer is shown to have been great by the skilful way in which he parodies the epics, and we are told that Aratus the

poet consulted him on the question how to obtain the best text.

Of his prose-writings two only are known to us at all clearly, viz. the Ilvdwvy in which he recorded his conversion to Scepticism, and the * ApKea-tkdov nepiBeLTTvov {Funeral Feast of Arcesilaus), a sort of palinode in which he atoned for the attacks that he had previously made on the same man. In the verse-writings the satiric intent is more obvious. Diogenes gives a formidable list, viz. tragedies, satyric plays or perhaps comedies, iambi (J)^ and — most important — Silloi. Nearly all the surviving fragments come from these last. Whatever the derivation of the word StWosj it implies a poetry of which the chief ingredients are ridicule and invec- tive. The style originated, as we have seen, with Xenophanes in the sixth century, and a generation before Timon seems to have been employed by Crates. Timon followed in the footsteps of Xeno- phanes, but like most satiric writers of his age, e.g. Menippus, added considerable elements from

Comedy, for instance a passion for monstrous compounds, an affectation which he shared with Cercidas. In his Silloi Timon's aim was to satirize the dogmatic philosophers and he realized this purpose by a parody of Homer in which the Epic phrases were perverted to expose the weaknesses and exaggerations of the various pundits, and in which whole motives, e.g. battle scenes, visits to the lower world, etc., were adapted for the same object.

In his satiric outlook as in his vagrant life Timon shows himself in sympathy with the Cynics, but in one. particular he was very un-Cynic. The Silloi is emphatically not a popular poem. To appreciate the satire it was necessary to possess a pretty comprehensive knowledge of the history of philosophy, and it was no doubt to give readers this knowledge that in later ages two scholars at least wrote commentaries on the poem. Thus though Timon sneered at the academic society of his day, the inmates of the Alexandrian Museum, his chief work must have been as much "caviare to the general" as was the poetry of the learned poets.

The main purpose of this lecture has been to

suggest that the conventional view of the Greek writing produced in the Hellenistic age is somewhat one-sided. The tendency of that view has been to stress the ∗' learned" character of the literature belonging to this epoch. Operating in the main with the works of the scientific prose-writers and the Alexandrian Poets and judging the latter rather on the form than on the content of their writings, rather in relation to Rome than to later Greece, critics have been misled into drawing a picture of [

Hellenistic literature which was too consistent to be accurate. The researches inaugurated by Rohde in his illuminating book on the Greek Novel have shown that even the Alexandrians bequeathed to posterity something more than the art of writing "learned" poetry brilliantly: on the other hand the Egyptian discoveries of the last forty years have brought to light two other types of Hellenistic writing which contrast sharply with productions of the poets attached to Court and Museum. These twp popular types are animated by a realistic spirit, while the learned poetry, in virtue of its material, exhibits incomplete but undoubted inclinations to romanticism.

The connecting-link between the Alexandrian Poets on the one hand and the Mime and Moralizing Writers on the other is to be found in such writers as Theocritus and Herodas, who handled the popular material according to the principles of Alexandrian art. The realism which, to a different degree of course, governs the work of the two poets just mentioned and which also appears with good effect in such compositions as the epigrams of Leonidas of Tarentum, dealing as these do for the most part with humble life, is found sporadically in more conventional worksof the Alexandrians, where its appearance is somewhat incongruous. Callimachus it is true in his Hecale seems to have given a charming picture of the old woman who entertained Theseus prior to his encounter with the bull of Marathon and of her rustic cottage, but the ordinary Alexandrian use of this motive was more artificial. The learned poets delighted to depict the life of the gods and heroes in all the

detail which they observed in the life of men. Sometimes the gods are described as living in the everyday fashion of the ordinary mortal, sometimes in that of a Hellenistic king or princess. Instances of the second kind are Apollonius' description of Eros and Ganymede playing at dice like two court pages, of Aphrodite at her toilet-table, or Theocritus' picture of Ptolemy Soter and Alexander conducting Heracles to his sleeping-chamber — "when he hath taken his fill of fragrant nectar." For the first sort we have Callimachus' interesting anecdote about Hermes and the daughters of the gods, how, when they are naughty, in collusion with their mothers he disguises himself as one of the Cyclopes and rushes out of the house to terrify them into obedience. Similar in kind are Theocritus' careful studies in the youth and upbringing of Heracles, or in the household arrangements of Alcmena and Amphitryon.

Touches like these seem to suggest that even the Alexandrians were not wholly uninfluenced in some of their ideas by the more popular tendencies of the age, but the diflference of standpoint between them and the other writers is far from being bridged by coincidences such as these just noted. Nowhere does that difference emerge more clearly than in a passage of Horace's Saiires^, where he first translates an epigram of Callimachus on the typical Alexandrian theme of the love which

Kol (f>evy€i <f>c\iovTa koI ov (f)i\iovTa BccoKCi^,

and puts it into the mouth of his romantic lover,

^ Sat. I. 2, 11. 105 sqq. ' Theocr. vi, 1. 17.

and then asks in language reminiscent of Diogenes or Cercidas, how pretty verses such as these can do anything to cure the torments and disorder of the soul :

Hiscine versicuHs speras tibi posse dolores
atque aestus curasque graves e pectore pelli ?

The indignant question might well stand as the verdict of the Hellenistic Moralists on their

Alexandrian contemporaries ; but there is no need why it should be ours as well. However much we may be compelled in the light of the new discoveries to revise our notions about Hellenistic literature as a whole, Alexandrian Poetry will still retain its importance and interest, not so much perhaps on account of its own achievement as for the sources of inspiration which it revealed to later writers. To take one instance out of many — Ovid, except for Alexandria, could scarcely have written his Metamorphoses^ and not only modern literature but modern art as well would have been the poorer for the loss.

HELLENISTIC POPULAR PHILOSOPHY

THE Macedonian conquest of the Nearer East marked a great epoch in human history. In the preceding centuries a culture of peculiar quality had been developed in the Greek city states which possessed the southern part of the Balkan Peninsula and tracts of sea-board in other parts of the Mediterranean Sea. That culture had already, when Alexander set out to attack Persia, produced the great works of literature and art which we study to-day as classical. Through the Macedonian conquest there came a great change. Hellenic culture had been generated and focussed in the frame of the city state, and if we cannot say exactly that the frame was now broken, it was at any rate depleted, depotentiated, when large numbers of the citizens of the old Greek cities were drawn away to populate the new cities in the East and when all Greek cities, old and new, had their scope of political action restricted by the predominant power of one or other of the new Greco-Macedonian royal houses. It has often been described how the individual Greek, under the changed conditions, found himself much more of a loose atom in a world of vaster geographical horizons. In the old days the life, political and social, of his native city had given the ordinary man all the interest he required ; its traditions and public opinion gave him

something of a moral code. But now its politics had become parochial by comparison with the larger world and failed to supply adequate interest,

whilst outside in the lands thrown open to commercial enterprise, in the courts and armies of Hellenistic kings, were new possibilities of excitement, adventure and the acquisition of wealth. In the markets and courts and armies Greeks from a multitude of different city states were indiscriminately mixed together, not a stable society with fixed traditions, but a crowd of individuals, each out for his own profit in the great scramble. A world of unrest, the Greek citizen diracinS^ unrooted, with no end in life but to get wealth, to get sensation, to get power — disorder and giddy chance in the place of the regular activities, amenities and duties of the old city state, a society demoralized as all societies must be in which there are continual dramatic vicissitudes of fortune, the same man now on the pinnacle of power and riches, now flung down into the mud. f There was no sense or principle or order in the course of things, it was just a huge haphazard play of chance, of luck, Tv^^y, the only deity to be discovered in the world.

But, of course, there were many people to whom such a world could not give permanent satisfaction. The hunting after riches and after sensation might fill life with interest for a time, but inevitably it produced often the reaction of a great weariness and disgust. Men who felt themselves whirled along in a confused dance came to long for some firm rule of life. The ancestral Hellenic religion, although it certainly had a moral element in it, although no doubt the idea that the gods, the

powers ruling the world, were on the side of righteousness, was still to some extent alive — the Hellenic religion was so mixed up with baser elements, at any rate with crude and primitive elements, that it could not supply such a guide as the Hebrew had in the Law of Jehovah. It was in these days that philosophy, which did purport to supply a guide, became popular as it had never been before.

Philosophers were to be seen everywhere — in the streets of the cities, at the banquets of kings — Platonic, Peripatetic, Stoic, Epicurean, Sceptic, Cynic, those of the ascetic schools being assimilated to the humbler class of manual workers in their dress — the plain sort of mantle called a

triboHy whilst philosophers generally were marked out, in a society where it was the rule for men of the upper class to shave clean, by the long beards which they were commonly believed to cherish with care and pride. Between the rival schools controversy was always going on, and it tended often to become violent. Lucian gives us vivid pictures of the wrangling and scuffling between philosophers in his time, the second century of the Christian era. But even in the earlier Hellenistic time we may see in Diogenes Laertius how bitterly the philosophers of different schools often attacked each other. Philosophers contended for the souls of kings. A curious document in this connexion is the life of the Epicurean philosopher, Philonides, deciphered a few years ago in a papyrus roll from Herculaneum. This man was a contemporary of the Seleucid king, Antiochus Epiphanes, the "little horn" of the book of Daniel, notorious for his

attempt to Hellenize the Jews by force. Philonides went to the Syrian court to convert Antiochus to Epicureanism, for Antiochus at the time apparently professed himself a believer in the rival Stoic creed. He was now plied with Epicurean tracts. We are told that after the king had read, or Philonides had read to him, no less than a hundred and fifty tracts, the good work was done and Antiochus embraced Epicureanism.

Whilst however these quarrels of philosophers are evidence that there existed sensible differences between the schools, perhaps what most strikes one to-day in going over the remains of that voluminous ethical literature which they severally put forth, is the extent of that which all the schools had in _\ common. The ideals of temper and conduct which govefned that ancient world, so far as men sought at all to rise above mere sensuality and greed of gain, were embodied in a kind of popular philosophy, much of which might have come from any of the rival schools. We may say that the aim which they all set up for the individual to strive after was expressed in the word avra/a/ceta, self-sufficiency, independence. The horrible thing, so it seemeH"m those days, was to be caught in the rush of this universal unrest which had no end or issue, to be

whirled along helpless like a stick in a torrent, at the mercy.of chance, Tv)(7)y Fortuna, at.the.mer€y- — :-^ of one^^s own spasmpdic desires. If the movement *" of the world, in which the individual finds himself involved, has no perceivable purpose, if there is no cause larger than himself which he may hope to see go forward, and go forward in some degree by his own devotion and efix>rts — then for certain men

there comes, sooner or later, an imperious desire to escape from the current, to find rest for the soul in some firm standing-place outside the turmoil. For some temperaments the continued excitements and pleasures of the world may keep up interest, may maintain a kind of intoxication which never allows this desire for emancipation to assert itself; but for other temperaments the cry for freedom arises with an urgency which will not be denied. It was to men in this mood in the Hellenistic world that philosophy came, to show them the way pf deliver- ance. Why were they entangled in this unrest, dragged hither and thither by forces outside their control.? The answer .jyaS— to be— found in the distrihiitipn of interest. Every interest man had in any object "was a filament, as it were, going out from his heart and attaching itself to that object, so that if the object was unstable and elusive he was pulled miserably after it. The way of freedom therefore was to cut all these strands going oiit in all directions and attaching to a multitude of objects, to abolish interest in everything except in — but at this point the schools diverged. They were all agreed that deliverance was to be found in re- ducing the field of interest; but they were not agreed as to the object upon which interest should be concentrated.

Most of this popular philosophy of the Hellen- istic and Roman world, whether uttered upon the air of the streets or embodied in little rolls of papyrus, has perished for ever from the memory of men, but we may see a specimen of it in the extracts from the sermons of Teles preserved for us by John Stobaeus. Teles, of whom we know

nothing except from these extracts, seems by-
internal evidence to have belonged to the middle
of the third century B.C. and to have drawn largely
from the written discourses of a much abler man,
Bion of Borysthenes — the far-off Greek colony in
the Crimea. Bion was the Cynic preacher, of whom
Eratosthenes said that he was the first to clothe
philosophy in gaudy raiment (dvdiva ivehvcrev).
There was something theatrical about his style,
and he drove home his satire by trenchant, often
coarse, colloquialisms. Teles too apparently fol-
lowed the Cynic way — the sect which went farthest
in denying values ordinarily recognized by the
citizens of Greek cities. The ordinary man's life
was largely governed by his attachment to posses-
sions of various sorts, to certain kinds of food and
to good clothes, to a particular place — his native
country — to particular people, his children, for
instance, and friends. It was this attachment which
brought all the trouble into his life and made him
dependent on circumstances outside his own con-
trol. The Cynics point out the way of securing
independence by a simple abolition of interest in
these things. Possessions ? Why, rich men don't
actually use a large number of the things they
possess. And what profit is it then to possess them ?
They have such things only in the sense in which
a banker possesses someone else's deposit (p. 26).
The slave gets on well enough without someone
to wait on him ; why should a free man be any less
independent ? Many poor men, Aristides, for ex-
ample, have been more honoured in their cities than
any of the rich (p. 36).

Food ? The roads are full of herbs and the springs

of water. Look, says Teles, at those old women
singing in their quavering voices as they munch a
common barley-cake (pp. 4, 5). You can buy a quart
of lupines for a copper coin (p.9). You don't need
a kitchen of your own to fry your couple of sprats.
The bronze-founders will no doubt let you use
their furnace (p. 30).

Good clothes.^ In cold weather there is no
need to seek a thicker mantle. You have only
to fold your present old cloak and there you
have a garment of double thickness all ready

(P- 30)-

Native country ? What of substantial worth does

the exile lose ? I am excluded, you may say, from the governing body of citizens in a strange city. But how many people in your own country are excluded from the governing body — women, slaves — and do not make a grievance of it ^ As for the disgrace of banishment, if you were banished, although virtu- ous, the disgrace is theirs who banished you, not yours (pp. 16, 17).

Fellow-citizens.'' In the present war, says Teles — that is, probably, the Chremonidean war (265-261), it is the rich man who is troubled by having to think about others ; the man who has attained freedom by having no dependents is in the happy position of having to think about no one but himself (p. 36).

Children and friends ? If the free man is not going to be worried about his own death, why should he be worried by the death of his children and friends .? "How unreasonable and utterly foolish for a man to sit weeping and mourning because his friend is dead ! Making himself ill as well ! If he is really

going to act according to the values of this mad world, it would seem to be more philosophic for him to grieve whilst his friend is still alive, reflecting that his friend will have to die some day. It shows a strange perversion of judgment, as Stilpo said, for a man to stop thinking about the living for the sake of those who are here no longer. That is not the way the husbandman behaves. If one branch of a tree dies, he doesn't lop off the others as well, but tends them with extra care, so that they may replace the branch that is gone. Because my son or my wife is dead, is that any reason for my neglecting my- self, who am still alive, and ceasing to look after my property?" (p. 46).

It is to be noticed that Cynics of the stamp of Bion and Teles do not advise any man to renounce riches or pleasure, if they spontaneously come his way. The game with Fortune is properly played if you take every bit of enjoyment that Fortune

offers you, but never let yourself become so dependent upon her, that you mind if Fortune takes anything away. "You," Teles says to a rich man, "give liberally and I take valiantly from you, neither grovelling nor demeaning myself basely nor grumbling" (p. 3). One short sermon which states this theory of life one may translate as it stands.

"Fortune is like a playwright who designs a number of parts — the shipwrecked man, the poor man, the exile, the king, the beggar. What the good man has to do is to play well any part with which Fortune may invest him. You have been shipwrecked ; very well, give a fine rendering of the part * Shipwrecked man.' You were rich and have be-

come poor. Play the part *Poor man' as it ought to be played.

Be your office great or small,
Equally at home in all —

contented with whatever clothing, whatever fare, whatever service falls to your lot, like Laertes in Homer :

With an aged woman to tend him, to set before

him still
Meat and drink.

And he slept, as we know, upon a bed of leaves.

"Such a life lacks nothing in pleasantness or healthfulness, so long as one's heart is not set on luxury.

Not in the belly's glut
Doth true good stand. (Euripides.)

No, nor in the style of a garment nor in the softness of a bed. Euripides says rather happily ;

Being luxurious
We hunt for new devices of strange foods.

Not foods only, but things to gratify our noses,

things to gratify our ears. Our rule should be *No luxury unless circumstances put it easily in our reach.' We should be like the sailors who observe wind and weather. Is the wind there, use it : no wind, then stop. Or like soldiers again ; the man who has a horse serves as a trooper, the man who has heavy armour, serves as a hoplite, the man who has no armour, serves as a psilast, and just as in that case, suppose the enemy make your position uncomfortable by his archery, you fall back, if you are a light-armed soldier, to the protection of the heavy

troops, SO if at any time you are assailed by war, by poverty, by sickness, retire to the lonely crust, retire to being your own servant, retire to the poor man's cloak, in the last resort, retire out of the world altogether."

In Lucian's little dialogue entitled Cynicus we have a defence of the Cynic way of life put into the mouth of one who practises it. "I have no desire," we find him say, "to be like the men of modern fashion, even if they suppose themselves to have made such a wonderful advance in happiness beyond their ancestors, in the way they eat and the way they dress, sleeking their skins and shaving the hair off their bodies. I boast that my feet are just like the hoofs of horses. I need an artificial bed no more than the lion does. I need expensive food no more than a dog does. Be it mine to have the whole earth for my bed, the whole world for my house, and the food which comes readiest to hand for my fare. Is my appearance not that most seemly for a good man — to be unwashed, to be hairy, to wear a poor man's cloak, to walk bare-foot .^ . .This cloak of mine, which you mock at, this long hair, this appearance of mine, has such power that it enables me to live in peace of mind, to do what I will, to consort with whom I will. For my appearance frightens off all who are fools and uninstructed ; soft-livers give me a wide enough berth ; but the men of finest temper, the men most truly reasonable, those who hunger after virtue, seek my companionship."

The Cynic sect, as was said just now, went farther than any other in a practical repudiation of the values which governed the ordinary man's life. But the Stoics, as is well known, took over from the outset a great deal of the Cynic teaching and the

Cynic ideal. Diogenes was, with Herakles and Socrates, one of the stock typical heroes of later Stoic philosophers. It is not therefore surprising that much in Seneca and Epictetus should be closely parallel to what we read in the sermons of Teles. The figure, for instance, of the actor who has to play well the part assigned him, which recurs in Teles, was also a favourite one with Epictetus.

" Do you not see that Polus did not act Oedipus the king in better voice or with greater pleasure than he acted Oedipus the poor beggar at Colonus ? What ! is the good man and true to shew himself inferior to Polus, instead of playing any part well that Providence puts upon him } Will he not rather make Odysseus his pattern, who was just as remarkable in his rags as in his rich cloak of purple .?" [Fragment 11. Translation by P. E. Matheson, 1916.]

What is more noteworthy, for our present purpose, than the resemblance between the Cynic and the Stoic is the resemblance between much in the Cynic-Stoic teachmg and wKat we find in the schools regarded as the precise opposite, the schools which made the chief good consist in pleasure. Teles himself on occasion reinforces his sermons by sayings of Aristippus, the founder of the Cyrenaic school. Teles indeed represents a brand of Cynicism which had probably become more assimilated to Aristippus than the founders of Cynicism, Antisthenes and Diogenes, would have approved. In his repeated counsel to use the opportunities for enjoyment when they are there. Teles is more Cyrenaic than true Cynic. When he says to the rich man "I take valiantly what you give" Teles reproduces precisely the position of Aristippus, who maintained that it

was no shame that he should enjoy heartily the pleasures which the gifts of kings and tyrants put at his command. But this blending of Cynicism and Cyrenaicism was possible only because there was an element of as^fij^fiisfn in the Cyrenaic philosophy which might seem at first sight incompatible with a philosophy of pleasure. Aristippus too was out to

procure avrdpKeia, independence of the caprices of Fortune, and he thought he found this independence just as Teles finds it, in keeping your inner detachment all the time you enjoy the gifts of Fortune, so that you are not in the least thrown out, when Fortune withdraws her favours. You score off Fortune, as it were, by taking everything that she offers and never letting your heart get entangled. The Cyrenaic way of deliverance, like that of the other schools, consists in the reduction of interest to a certain narrowly limited field, a cutting off of the interests which entangle the heart in things outside this field. The one thing we really possess, said the Cyrenaics, was the present jnoment. If therefore you savour to the full every bit of enjoyment that the present moment offers, and cut off the interests which make you regret the past, or fear the future, you attain deliverance. So far as it meant this cutting off of interests, there was an ascetic element in the Cyrenaic philosophy. And Aristippus on occasion could show just the same inner detachment which might have been shown in similar circumstances by a Cynic or Stoic. There was the story to which Horace alludes in one of his Satires, how Aristippus was once making a journey over some bit of the African desert with his slaves carrying bags of gold, and how, when the load seemed too much

for them, he ordered them simply to throw the gold away.

The as^gtlc element is still more strongly pronounced in Epicureanism. Perhaps when I read out passages from Teles just now, someone may have been struck by the very close resemblance between the attitude he describes and that described by the Epicurean poet Horace, in the famous stanzas :

Fortuna, saevo laeta negotio,
ludum insolentem ludere pertinax,
transmutat incertos honores,
nunc mihi, nunc alii benigna.
laudo manentem, cum celeres quatit
pinnas, resigno quae dedit et mea
virtute me involve probamque
pauperiem sine dote quaero.

That is not Stoic, nor Epicurean, nor the distinctive philosophy of any one school ; that is a bit

of the popular philosophy common to all the philo- p
sophic schools of later antiquity.

According to Epicurus too, deliverance is found
by rigidly cutting down the field of interest to a
certain small compass. That compass, it is true, is
pleasure, Epicurus differing however from the
Cyrenaics in denying that the present moiuejtvtis .^^.
our only possession. We possess the past top by
the pleasures of memory, upon which Epicurus
laid great stress, and in choosing pleasure we have
to take account of the, futu.re^_i:onsidering what
kind of pleasure has the greatest promise of
durability. But when Epicurus says that the chief
good is pleasure, you have to understand in that a
negative, as well as a positive, assertion ; it means
that a large amount of interest going out in all

!/

directions without profit ought to be negated and
cut off. The scientific interest, to know the truth
about the world for the sake of knowing, is a
vanity. Epicurus is very strong that we only need
> to know as much about nature as will secure us
from being afraid of any imaginary supernatural
power behind the movement of the world. For
that purpose it is quite enough to see one way, or
a number of different ways, in which meteorological
phenomena, for instance, might have been produced
by physical causation, because that shows the hypo-
thesis of divine agency to be unnecessary; but it
is mere waste of time to try to find out which of all
possible modes of physical causation does, as a
matter of fact, bring them about. He says this
over and over again in the Letter to Pythocles.
And when he comes to explain what he means by
pleasure, you find that the true end is not so much
-^ pleasure as the absence of pain. And if you strictly
limit yourself fo this you can secure it by quite
simple means and be practically independent of
Fortune. You choose the plainest fare, you choose
enjoyment that does not involve any violent emo-
tional disturbance, you mark out this field and cut
off the interests which range outside of it ; then
you are safe. "Let us give thanks to blessed
Nature," one of his recorded sayings, "that she
made necessary things easy to come by, and things

difficult to procure unnecessary." For the happiest life a fare of barley-bread and nuts suffices. If he had barley-bread and water, Epicurus said, he was prepared to set his happiness against that of Zeus. He seems to have practised and recommended regular fasting on certain days every

month, in order to procure greater independence in the matter of food \

Epicurus was sometimes represented as profligate because certain hetairai were amongst his associates. But, as a matter of fact, he seems to have looked rather with dislike upon the emotions of physical love, because of their disturbing character ^ Thus Lucretius in dwelling upon the discomfort and ugliness of sexual gratification, and Tennyson in his description of the disgust and self-loathing created in Lucretius by the love-potion, seem to have been quite in accord with the feeling of the Master himself.

There is certainly an ascetic element here and we can understand why Seneca so continually quotes sayings of Epicurus, as admirable from the Stoic point of view.

"If you wish to make Pythocles rich, do not add to his money, but subtract from his desires." {Ep. 21, 7.)

" I have never wished to please the multitude, because the things which I know the multitude disapproves of, and of the things of which the multitude approves I know nothing." {Ep. 29, 10.)

"You should make yourself the servant of philosophy, so that there may come to you true liberty." {Ep. 8, 7.)

"Poverty brought within the compass of the law of nature is great riches." {Ep. 4, 10.)

"Cheerful poverty is a thing of beauty." {Ep. 2,6.)

1 Sen. Ep. 18, 6.

* ipa<r9TJ<r€(T6ai tov aocfiov oi Soxei aiTOL<;,..ovSk OeoirefX'Trrov etvai TOV tpwra (Diog. x. 1 8). crvvovair) wvrjae /i,€v ovScttotc, ayaTTip-ov 8" ci fxr) e^SAai/^e (Usener, frag. 62). Cf. Senf. Vat. 51.

" He enjoys riches most, who has least need of riches." {Ep. 14, 17.)

'*It is especially when you are compelled to be in a crowd that you should retire into yourself." {Ep. IS, 6.)

" If what a man possesses does not seem suffi- cient to him, he will be miserable, even if he becomes lord of the universe." (Ep. 9, 20.)

" Excessive anger begets insanity." {Ep. 6, 4.)

"The unwise life is disagreeable and full of trouble ; it is all reaching out into the future."

(^/•i5. 9-)

"The wise man, though he is being roasted in

the brazen bull of Phalaris, will exclaim 'O the pleasure that I enjoy! All this is nothing to me'." {Ep. 66, 18.)

All sects alike, we have seen, aimed at making the individual independent of the play of Fortune, and all sects alike declared that such independence was to be secured by cutting off interests outside a certain prescribed field. They differed when they came to state what the prescribed field was to be. It is plain that supposing you could cut off interest altogether, you would secure complete indepen- dence ; Fortune would no longer have any purchase at all. The Cynics went farther than other sects in negating generally recognized values. They abolished, for instance, as we have seen, the interest in cleanliness. Even the Stoics did not do this. Epictetus especially required his disciples to be dressed indeed with extreme plainness, but to be clean and sweet in person. Yet it is plain that if you have an interest in being clean, you are to that extent within the grasp of Fortune ; you are

certainly more independent if it makes no sort of difference to you whether you are clean or dirty. In the ideal of heroic virtue which came up with Christian monasticism the indifference to cleanliness was, as is well known, a prominent characteristic. Augustine writes in a letter of counsel to some nuns: "Lavacrum etiam corporum ususque balnea- rum non sit assiduus, sed eo quo solet intervallo temporis tribuatur, hoc est semel in mense."

St Jerome, describing his condition when he was living as a hermit in the Syrian wilderness, writes : " Horrebant sacco membra deformia, et squalida cutis situm aethiopicae carnis obduxerat." " My skin was covered with a coating of dirt which made it look like a negro's."

Christianity was here perfectly in agreement with the Cynic ideal of independence. The Em- peror Julian, the would-be champion of Hellenism against Christianity, was wont. Gibbon tells us, to jest about the populousness of his beard.

A thorough cutting off of all interests must no doubt include the interest in cleanliness amongst the rest, and a thorough cutting off of all interests would unquestionably destroy everything by which Fortune has a hold. Why was it that the ancient philosophies could not simply prescribe this thoroughgoing method ? Why must they still leave some field for interest to be directed on? The reason is, of course, that they needed, not only to secure a man independence, but to leave him still some mptiye for action, and without interest in something no "rhotive for action is possible. If man had been a purely passive being, it might have been possible to advise an extinction

of all interest. Because man was under the necessity of acting in some way or other, they were bound to leave him some interest by which action might be prompted and guided. But how can you give man an interest for action and not, to that

T extent, sacrifice his independence? This was the standing crux, the essential problem, of the later Greek schools of philosophy. Having cut a man off from the world, as far as you can, for the sake

_ , of independence, you had to bring him back to the ^^ world as an agent. How was this to be achieved .? Epicurus thought you could manage it by cutting down the field of interest to such simple pleasures as you might be pretty sure of having at your command, whatever turn Fortune took. Interest in these would be enough to give the wise man all the motives for action he required, and at the same time not put him dangerously at Fortune's mercy. The Sceptic plan was to bid the man take, as his guide for action, the ordinary conventions of society, which he found established, but to keep his interest in check by telling himself all the time that he did not know whether any object of action was good or evil. The Stoic plan was the most subtle and elaborate. Interest was to be concen- trated upon the action itself, never upon the result of the action. A man should have full satisfaction in the consciousness that his action was right, whether the thing he tried to do was achieved or not. But, since action is at any rate directed upon outside things, that leaves one still in need of some principle by which right objects of action may be distinguished from wrong. And so the Stoics planned a scheme of values in outside things —

they actually used the word ct^ta — which yet were to be wholly separate from interest — a difficult business, but it seems to me that a figure I once used in a book of mine may help us to understand what they had in their minds. If a servant is sent to fetch a parcel from the post office, his whole action will be determined by the intention to get the parcel, but he will have no interest in the parcel which will make him disappointed if he finds, when he reaches the post office, that the parcel has not arrived. He will be satisfied with having performed the action commanded. Just so, for the Stoic, riches, for instance, are one of the things that have value. If a Stoic is in business he will conduct his transactions in the way which he thinks will be most profitable — consistently, of course, with honesty; Reason, God, Nature — he used all words to mean the same thing — commands him in certain circumstances to make the acqui- sition of wealth the object of his action. But he will be perfectly indifferent as to whether he succeeds. He will do his level best to grow rich, ' but if, by some caprice of Fortune, his ships are

swallowed up by the Icarian Sea under the buffeting of Africus, and he becomes bankrupt, he will not suffer a pang.

That was the object of all the schools, to create in the midst of this rushing, fevered, tumultuous, distracted world the Wise Man, a figure of abiding and unearthly calm. He looks at you with eyes in which there if S* benign and radiant serenity — something really unearthly and strangely quelling — because in him the interests by which you and I are driven hither and thither are dead. "Nil

admirari prope res est una, Numici, Solaque quae possit facere et servare beatum," says Horace. "Nil admirari" — to be beyond fear and beyond wonder at the spectacle of all this vast world moving round us

hunc solem et Stellas et decedentia certis

tempora momentis.

Where men have made this detachment the ideal after which they strive some have really come by self-discipline sufficiently near it to be extraordinarily impressive. In India to-day, where an ideal analogous to the Stoic has prevailed, there are a certain number of individuals who do disconcert Europeans by their appearance of having attained an uncanny satisfaction and tranquillity. There must have been similar figures in the Greco-Roman world. Even Lucian, who mocks so habitually at the false philosophers, occasionally draws the portrait of a true one — Nigrinus, Demonax.

It is certainly impressive, the attainment, or apparent attainment, of this ideal. Yet one must question whether it is one which the human spirit, in its full development, can find adequate. A different ideal was before the minds of the Greeks in the great stirring days of the free city state ; a different ideal has been before the modern European world. That other ideal too, so far as it is attained, frees a man from dependence upon Fortune, but it does not free him by cutting off his interest from outside things. On the contrary, his interest is heightened and intensified. Interest, it

is felt, is life, and, when all is said and done, the quietness attained in the Stoic, and in the Indian,

way, is too like the quietness of death. The alternative ideal is, I think, expressed in the word "a causey I do not, of course, mean cause as the correlative of effect, but cause in the sense in which we speak of some cause for which men will live and die — a national cause, a religious cause. There seem to me to be three essential elements in the idea of a cause, (i) It is the interest, not of an individual only, but of a great organic body, a society, a community, to which the individual belongs or attaches itself. (2) It implies an effort, extending through time, perhaps through an indefinite number of generations, to realize the common ideal in the outside world of fact. There is a fighting quality in it, a determination to overcome obstacles, to remake the world according to the heart's desire. (3) It implies, as a rule, an optimistic hope, a belief that the victory of the cause may really sooner or later be won. We hear, of course, of people who fight heroically for causes which they know to be irretrievably lost ; but it may, I think, be questioned whether anyone fights for a cause for which he has no hope at all ; there is probably in the cases spoken of a kind of wild hope that after all, by some unlooked-for chance, one chance in a hundred, the victory may yet be won, and it is that faint chance which makes it worth while to go on fighting.

The citizens of the old free Greek states, the citizens of the Roman Republic, found their happiness, not in detachment, but in the cause of their civic community, by losing themselves as individuals in the great communal passion for promoting the glory and power of Athens or

Sparta or Rome. And if one described in a single phrase why it is that the Hellenistic and Roman world, after political liberty is gone, seems to us, for all the culture, all the economic activity, all the virtue it still embodies, to be steeped in a

kind of dead atmosphere, an aura morta^ we may say that it is a world without causes. There were no great modifications of terrestrial things which were to be brought about by the corporate effort of some society to which this or that man belonged. All that the virtuous man could do was to do his individual duty, to play his part, in a world which was never going to be any better than it was in his own day, nor indeed ever very different, till it broke up in some cosmic cataclysm. We are often told that the decadent Greco-Roman world shows strange analogies to the world to-day, and so it does — the sophistication of life, the craving for sensation, the credulous attraction to the occult. The inference is sometimes made that our own civilization too must be in its dying phase. But the analogies should not make us overlook the enormous difference between those times and our own. Modern times are times in which there is a notable plenitude of causes. There is hardly any-one who is not attached to some cause in whose advance he believes. There are all the national causes: in England there are still people for whom devo-tion to the old country provides the cause which seems to them to be the one of substantial reality ; they look forward to an increase of England's, or of the British Commonwealth's, power and dignity in the world. There are other people for whom the worthiest cause seems to be to establish inter-

national co-operation in the place of national antagonisms, for whom the League of Nations, or some League of Nations, seems the thing su-premely worth working for. There are others whose cause is the coming of some better political and economic order all over the world — some form of Socialism or Communism. There are others whose cause is more distinctly religious — the coming of the kingdom of God. And we must not forget that notable band of men for whom the increase of scientific knowledge is the great cause, those who watch the gradual victorious advance in different lines of research — one new bit of knowledge to-day, another to-morrow, added to the slowly growing total, and whose lives will seem to them well spent, if one little solid addition is made to that total by their own individual work. The idea of some cause going forward, some cause to which we can contribute, is so bred in the bone of

modern men that we can hardly imagine a world in which the hope of improvement and advance is absent.

It would not be true to say that the ideal of emancipation in the ancient world was entirely individualistic and selfish. No people have laid greater stress than the Stoics did, for instance, upon the individual's solidarity with the Universe, and especiallywith other rational beings. Epictetus, Seneca, Marcus Aurelius, are full of the duty incumbent upon the individual to serve and help his fellow-men ; we are none of us, they continually say, born for ourselves alone. That may seem to come near to what I described as a cause, and it certainly has one element of a cause, the recogni-

tion by the individual of a larger body to which he belongs and whose interests he is bound to make his own. But it seems to me to lack the other elements in a cause — the conception of some particular end to be realized by corporate effort in the actual world and the hope of that end being achieved. According to the Stoic idea, the good man has simply to play his part nobly in a world which is never going to be very different. That is the still, sad note of Marcus Aurelius. The phrase "play his part" gives indeed the figure to which, as we have seen, the practical philosophy of the Hellenistic age habitually recurs — the figure of the actor in a play. And that is significant. The actor, unlike the soldier, is not helping by his effort to decide an issue still undetermined, he is not \engaged in any struggle for a cause, he is just going 'through, well or ill, the fixed part assigned.

Perhaps I should try to explain what I meant just now when I said that devotion to a cause, whilst it directed interest upon outside things, nevertheless made a man independent of Fortune. For it is quite obvious that the advance or setting back of a cause does depend, like the prosperity of an individual, upon many outside accidents ; causes upon which men have set their hearts sometimes come to grief and finally fail. But the point is this: because the interest embodied in the cause is the interest of a community and because the life of a community reaches out into an unknown future beyond the life of the individual, a set-back to the

cause in which a man is interested may leave his hope of its ultimate triumph unshaken. His hope may in the end prove to have been a delusion, but

it can hardly ever be proved to the man himself that it is a delusion. The utmost malice of Fortune may leave him still confident ; he may fall himself in fighting for the cause and die happy, because his interest has ceased, as the psychologists say, to be egocentric and has been transferred to the being of the beloved community. "Who dies, if England lives?" The vitality of some causes in the face of what would seem overwhelming facts is astounding. One would say, for instance, that if any cause definitively and for ever failed, the national cause for which the Mexicans under Montezuma fought against the incoming Spaniards 400 years ago did so. I was told however not long ago by someone who knew intimately the native peoples of New Mexico that they cherished still, by a secret tradition, the unconquerable belief that Montezuma was not really dead, that one day he would come back and drive out the white man and restore the world as it was before. In some villages it was the custom for a man to climb every day before day-break to the top of a neighbouring hill and all alone watch the dawn, because that might be the day when Montezuma would return. A man who has lost himself in a great cause is, if not invulnerable by Fortune, at any rate safe from utter overthrow. Into the dead atmosphere of the Greco-Roman world came Christianity. The question has often been asked what Christianity brought that world which it had not got already. To a large extent the ethics of the Christian Church and the ethics of the Hellenistic moralists ran together. It is claimed sometimes that the theological beliefs and ritual practices of the Church had their close Hellenistic

parallels. What then, it is asked, was there special and distinctive about Christianity ? No doubt many-answers may be properly given to that question, but there is one short answer which I think will serve. It was a cause. That is why it came into the dead atmosphere like a breath of new air. Men drawn into this society felt that they came into a

stream of more than individual life, setting through time towards a great victory. The life of this community was indestructible ; the will embodied in it was a Divine Will by which all outside things were to be ultimately shaped and subdued ; men might be fellow-workers with God towards the great end ; they might give the cause the supreme sacrifice of their lives \

No doubt this distinctive note of Christianity was due to its Hebraic origin, as distinguished from those elements of Hellenism which it absorbed. It carried on the hope of ancient Israel — a com- munal hope, an expectation of the Day of Israel's God^ Christianity has remained always essentially

^ It would be a mistake, I think, not to recognize that the maintenance of the ancient Hellenic religion itself took on the character of a cause in the fourth century, when it made its last forlorn fight against Christianity. It has often been observed that in Julian's revival of paganism there were features borrowed from the organization of the Christian Church. But the assimilation of Hellenism to Christianity in those days was deeper than the mere borrowing of this or that feature. In becoming a cause Hellenism aroused a new kind of feeling in its adherents.

' If one were giving a complete account of the Christian view of the time process one ought also no doubt to recognize, the influence of Zoroastrianism. For the religion founded by Zoroaster in Persia has essentially the marks of a cause, laying stress on the fight for the good in the world against evil with

Hebraic. We hear a great deal to-day about Saint Paul and the Hellenistic mystery-religions. Strik- ing parallels have been pointed out : in the Greek mystic sects too a man received apparently a new supernatural life through some initiation, and there were ceremonial rites of admission and of member- ship, which show analogy to baptism and the eucharist. Some people have been therefore disposed , to regard Christianity, in the form given it by Saint ; Paul, as simply one more mystery-religion added \ to the rest. But this is to overlook the most essential thing in Christianity — that which consti- tuted it a cause. In the Hellenistic mystery- •■ religions the man who received initiation was \ simply lifted out of the lower sphere, individually, i into the higher sphere; there was, so far as we

know, no common purpose which the society was set | to achieve in the real world. The man brought / into the Christian community was brought into a stream of dynamic life going through time towards a definite consummation, a divine event, in the future. That remained essential to Christi- anity, even when it later on borrowed Hellenistic j moulds in which to cast its dogmas : we must not i be misled by the Greek modes of thought and ex- / pression so as to overlook the abiding Hebrew

the assurance of an ultimate cosmic triumph for good. The apocalyptic phase of Judaism probably shows Zoroastrian in- fluence, and Christianity in drawing from Judaism drew thus indirectly from the inspiration of Persia as well as from that of Israel. Just because Mithraism too had one of its roots in Zoroastrianism, this later rival to Christianity may have had a character which would entitle it to be reckoned a cause. Mithraism seems certainly to have been on a higher moral I level than the common run of Hellenistic mystery-religions. '

core — the ruling idea that here was a Divine Society called to work and fight through the ages towards a consummation on beyond, even if delayed, none the less sure. You get it put in the forefront by Saint Augustine in his idea of the Civitas Dei, the Society which he sees running through human history, from the first beginning of man, contending in each age under varying tribulations, for the one great cause,withthe assurance of ultimate triumph.

To-day, as I have said, we have such a plenitude of causes inviting our devotion, that it is difficult perhaps to realize what the teaching of the old philosophies meant for those to whom the movement of the world was an unrest leading nowhere. To- day we may question the belief in progress as an abstract proposition, but it is so inwoven in our thoughts that it is difficult for us to divest ourselves of it. The actual fact of progress in certain lines is too near to us and too obvious — the astonishing advances which science has made in recent times and is still making, the raising of the standard of life, at any rate on the side of material comfort, for those who do the manual work of our civilization, the growing possibilities of human in- tercourse which are unifying the globe to a degree unknown ever before. But supposing we were

ever in our Western world to lose this assurance of progress, recent as it indeed is, supposing we were to become thoroughly disillusioned by future adverse experience, as to any national cause being worth fighting for, as to any international harmony being practicable, as to any new social order removing present evils, as to the advance of science

continuing, or, if it did continue, increasing human happiness, and supposing at the same time men lost the supernatural hope which makes Christianity, as George Tyrrell said in his last pathetic book, if a pessimism so far as this earth goes, yet an optimism with regard to the sum of things — supposing this happened, then, I fancy, the best men would once more feel that in such a world there was nothing for them to do except just to realize in their own individual lives an ideal of dignity — to play their part creditably. To them the allusion with which Teles closes one of his sermons, and which Cicero and Seneca and others repeat after him, would come home : "That was a f fine gesture of the skipper's : * You may sink her, ■ Poseidon, but true to her course it is that she'll go down.' So may a good man say to Fortune : *But it r is a man that you'll find, no shirker, no coward.' " '

THE SOCIAL QUESTION IN THE THIRD CENTURY^

I AM going to speak this afternoon about one aspect of the social problems of the century after Alexander, the conditions that made for social revolution. I shall start from an extraordinary provision in a mortgage deed, which only seems explicable from the social background of the time ; and we shall have to see what that background was, which means wealth and poverty, and consider the great economic disturbance in the generation after Alexander, and how it affected the working man, which

means prices and wages. Thanks to the temple accounts at Delos, though at present they are only published completely from 314 to 250, we have now something definite to go on ; and we can compare them with various fourth century accounts, especially those of Eleusis in 329. We shall see that the gulf between rich and poor has become wider, and that underneath the brilliant civilization of the third century lies the fear of social revolution. Finally I shall say something, from the social side, about the revolution at Sparta, as it is our best account of a social revolution.

The mortgage in question dates from early in

^ I desire to express my obligations in part of this paper to Professor Glotz' articles on prices and wages at Delos in the Journal des Savants for 1 9 1 3.

the third century, when many of the Islands were borrowing to pay Demetrius' taxes. Praxicles of Naxos lends three talents to the city of Arcesine in Amorgos at io°/^ interest, and the city mortgages to him all its own property, all its citizen's property, and all its metics' property, both in Amorgos or overseas ; and it is provided that the city shall not pass any law or do anything which shall override the mortgage. The other provisions I need not go into now. The usual explanation of this deed has been that the islands were very poor (we shall see that that was not the case) and that Arcesine's credit must have been utterly ruined for the city to consent to such terms. Unfortunately, Arcesine's credit was particularly good, as one can see from the rate of interest on another loan. In the fourth century the usual rate on mortgages and loans other than mercantile loans had been 1 2 "/^j except for the temple at Delos, which lent at 10 7o throughout its history; but 12 7^ could not survive cheap money, and the last cases of it we meet are at Teos about 300 and at Arcesine soon after. Praxicles' mortgage seems to be the first case, outside Delos, of 10 7o> which became the usual rate in the third century, and is found at Ilium, at Oropus, and at Peraea. But Arcesine raised a third loan about this time at 8-J- °/^, the lowest business rate known for nearly a century ; for the 6 °/^ which occurs in a loan to Miletus in 282 seems to be a favour, into which political reasons enter. This loan at 8^°/^ shows

that Arcesine was really pretty prosperous; one may also notice that the city had no need to entice anyone to lend it money by promising honours to the lender, as some cities did in the second century.

Yet, in spite of this, does not the city give Praxiclcs an absurd amount of security for the small sum of three talents ? A city generally mortgaged either certain lands or certain revenues, as for instance Delos always mortgaged its 2 °/^ import and export duties ; but extraordinary mortgages do occur, as when Lampsacus in the fourth century mortgaged its Acropolis, and perhaps it does not really mean much for a small city to mortgage all its property, provided it meant to pay. Similarly, a mortgage of the property of all the citizens is only an extension, though a considerable extension, of the usual practice, which was to mortgage the property of certain citizens as sureties ; Miletus in 282 thus mortgages the property of no less than 75 citizens. But what is extraordinary is to mortgage the property of metics ; and the fact that we know of one or two other cases of this in the third century does not make it less so. Metics of course were still looked down upon, as Teles shows, and Heraclides frankly calls their position at Athens one of servitude ; while the wood and charcoal law at Delos was soon going to revive the bad old custom of allowing a creditor to seize the metic's person. Still, even so, as Praxicles' security was ample, why was metics' property inserted.'' The answer is to be found in the inclusion of overseas property, which here means ships and their cargoes, as Arcesine owned no property overseas. For metics were often traders and ship-owners ; and the right given to Praxicles to seize metics' property as well as citizens' property really means the right to seize any ship belonging to any inhabitant of Arcesine without enquiring as to the owner's

Status. If he insisted on this right, he must have thought that his security over property in Arcesine itself might become valueless ; and only one thing could make it valueless, a revolution and cancellation of debts. In that case he could get nothing from the city; but he could still seize a ship, and

there are two cases known where mortgagees did seize ships. That is why he inserted the clause forbidding the city to pass any law overriding the mortgage. Naturally it could not be enforced ; a city could pass any law it pleased, and there had recently been a famous case at Ephesus, where mortgages on land had become so heavy that the government had constituted itself a committee of public safety and compelled all mortgagees to accept what was in effect part payment only. But the clause meant that, if a revolutionary government cancelled Praxicles' mortgage, and he seized a ship, and the matter came to negotiation or arbitration, as it probably would, he could fairly claim that he was within his legal rights. I may add that there was nothing in all this to hurt Arcesine in the least, provided she meant to pay. It used to be suggested that her credit must have been very bad or she could have borrowed from the temple at Delos on simpler terms. But this depended, not on her credit, which was good enough, but on the temple. The temple at this time had only eight or nine talents of liquid funds available for lending; the city of Delos had first call on this, and one fair-sized loan, like the five talents lent to Hermione in 274, would exhaust the balance ; it was just a chance at any moment whether Apollo could lend you three talents. Besides, if you borrowed from a private

person you could, if you chose, procrastinate a good deal over payment — there are some extraordinary cases ; but Apollo could appeal to his suzerain, and you might get a visit from that suzerain's fleet ; that did happen.

Now why was Praxicles, in the prosperous world in which he lived, afraid of revolution ? For the century after Alexander was a prosperous time for the upper classes in most places; Polybius' lamentations about the state of Greece belong to a much later period. I suppose now one need hardly enlarge on this prosperity. One sees it in things like the great number of new festivals which appear and the growth of a class of professional actors and athletes for their service; in the outburst of new associations round about 300, and in particular of social clubs, eranoiy where the subscriptions were of importance ; in the growth of table luxury ; above all, in the expansion of trade, of which I

may give one very simple illustration : about 400 the annual produce of the 2 °/o import and export duties at Athens wasround about 2 00,000 drachmae; at Rhodes, which had taken Athens' place, it had by 170 reached a million. But as at present we are talking about the island world, I will give some definite indications of that prosperity in the islands, taking Rhodes and Delos for granted. The only business rates of interest lower than the standard I o °/o which we meet in the third century are in the islands ; 8–^ °/^ at Arcesine, and at the end of the century 7 °/^ as the normal rate in Thera. That is, capital was cheap. We possess from Mykonos part of a register of dowries, eight entries. The two highest are 14,000 and 10,000

drachmae, that is, they average two talents. I think we only know one certain case of a dowry of as much as two talents in fourth century Athens, and two or three of one talent. On the other hand, a list has been published of Athenian dowries collected from the inscriptions, fourth to second centuries, eleven in all ; the average of these Athenian dowries is 2840 drachmae, that of the Mykonos dowries is 4450. We possess from Tenos part of a register of sales of real property, third century. The entries are very numerous indeed, and bear witness to a flourishing commercial community in which there was a ready market for land. In some cases the vendor allows the whole of the purchase-money to remain on mortgage ; very optimistic, but it does show confidence in the future of real property in the island. About 200 the island of Cos raised a voluntary subscription to equip a fleet. Two hundred and twenty subscriptions are extant; they include one of 7000 dr., one of 4000, seven of 3000, and twenty-two of 1000 and over. I think this is a higher level than we meet anywhere except perhaps in Demosthenes' Athens ; the largest subscription is identical with the largest subscription given toward the new temple at Delphi in the fourth century, and that was given by Sparta, then the richest state in Greece. The prosperity of Cos is confirmed by the great number of religious embassies sent from Cos to Delos in the third century, one of which was conducted by Theocritus' friend, the Aratus of the sixth and seventh idyls, who can now be identified in the inscriptions. There is also the evidence of the

clubs. In Epicteta's association at Thera the fines

for breach of the rules ran from 150 to 500 drachmae, while the highest fine in any association at Athens was 50 drachmae; and it was in the islands, at Cos and Thera, that the third century-clubs started the practice, when they honoured members, of substituting a gold crown for one of green leaves. I may add that two islands, Thera and Siphnos, both honour Egyptian officials with crowns of 2000 drachmae, which is enormous as crowns went ; I think you never get over 1000 drachmae at Athens. These sort of items do indicate a good deal of prosperity among the upper classes. It is no objection to this that various islands borrowed money to pay Demetrius' taxes. For one thing, they had borrowed much more heavily during the second Athenian con-federacy ; and for another, borrowing is no sign of poverty in a city — London, for example. It seems certain that some Greek cities in the third century did understand systematic borrowing; Delos for instance was regularly financed by the temple, as some modern businesses are by their bankers ; the city was constantly borrowing and repaying, and sometimes it repaid very quickly; thus in 282 it bor-rowed 2 5,000 drachmae and repaid nearly 20,000 the same year. A Greek city had no budget and as a rule no reserve ; it merely earmarked certain receipts to certain expenses ; if a new expense arose, like a war contribution, it had to levy a special tax, or raise a subscription, which took time ; it was a convenience to borrow the amount and then pay off the debt at leisure, and that is all that much of the borrowing comes to. To give one simple illustration. In 1 80, Delos had a large sum on deposit in the temple, and

yet borrowed lOO dr. from the temple for a crown for somebody ; the reason was that the money on deposit belonged to an account which was ear-marked for the city's corn supply.

The third century then was a prosperous time for the upper classes, just as one would expect from the brilliant culture of the period. But when we turn to the lower classes, we shall find conditions exactly

reversed ; they were definitely worse off than they had been ; speaking generally, prices were up and wages were down. The first thing to look at is the economic disturbance caused by Alexander's release of the Persian treasure, a disturbance which followed right upon the very considerable rise in prices which had taken place in the two generations before Alexander, caused by the secularization of the temple treasures at Athens, Delphi, and elsewhere. Let me remind you what the Persian treasure meant. Athens began the Peloponnesian War with 6000 talents in hand. Apollo of Delphi, before the Sacred War, was traditionally worth 10,000 talents. Alexander secured 180,000 talents in coined money, and perhaps an equal amount in bullion, plate, and so on. Naturally the economic disturbance in Greece was very great. One ought to be able to show it by price curves. Unfortunately the curve I should like to give, wheat, is not complete enough; and one complete curve, the price of pitch, is useless for my purpose ; for pitch was a monopoly, and political reasons enter into the price. I have however taken out two curves which I think are new and are free from objection ; one is the wages of a hoplite — citizen troops, not mercenaries — and the other is the rent of the farms belonging to

the temple at Delos. In the Peloponnesian War a hoplite got a drachma a day at Athens, but not much over four obols, Athenian currency, in the Peloponnese. (I am including in wages the so-called food allowance, which often is not distinguished.) At the beginning of Alexander's reign the hoplites of the states in the League of Corinth probably all got a drachma a day, as that was what Alexander paid his best heavy infantry, the hypaspists; anyhow, they cannot have got more. But in 303, when Demetrius re-formed the League of Corinth, the hoplites of the League states were getting two drachmae a day, just double. In the treaty between Aetolia andAcarnania of about 272 they still get two drachmae, but they are Corinthian drachmae, say eight obols in Athenian currency ; soon after 229 Antigonus Doson is paying about the same ; and about 200 Rhodes is paying nine Rhodian obols, which is again about eight obols in Athenian currency. That is, between 335 and 303

a hoplite's pay doubled ; in the third century it fell back again, but still remained 33 °/o higher than the old standard. Now the farm rents. I take only the 15 farms which the temple had always possessed, and omit the farms purchased at the beginning of the third century. The total rent of those 15 farms in drachmae, omitting sums under 100, is as follows. In 434 it was from about 7500 to 7600. In the four years 377 to 374 it was 7800. At the letting of 314, the first year of Delos' freedom, it was 11,500, an enormous rise. In 305 it was 14,300; at the letting of 300 it was 16,200, the highest point touched. In 290 it is only 9600, an exaggerated fall which must be due partly to

external reasons, perhaps the threatened descent of Etruscan pirates; for in 280 it recovers to 10,300 and in 270 to 1 1,300, and here I imagine we are on the true curve again. In 260 it has fallen to 8800, and here the real rise in the value of money shows itself. In 250 there is a slight recovery to 9300; but by 220 it is down to 6100, and by 179 to 5900. That is, in 300 the rents are more than double the highest figure of the period before Alexander. Taken together, these two curves justify us in supposing that the lowest value of money, that is, the highest prices, were round about 300, and that the drachma at that time was not worth more than 50°/o> or say three obols. One can confirm this by the fact that at Demetrius' siege of Rhodes in 304 the ransom fixed for a free captive was 1000 drachmae, as against 300 to 500 in the Sacred War. The culminating point cannot have been much earlier than about 300 ; for the law which regulated the letting of the farms at Delos, passed a year or two before 300, provided that a tenant could hold on for a second term, with- out having to bid at the auction, on paying 10 °/^ increase of rent ; that is, money was falling in value. I come now to the main question, how did all this affect the working classes ^ Here we must turn to Delos. First, their expenditure — that is the price of food, clothing, housing, and fuel. I may leave out fuel, for the price of firewood at Delos down to 258, when there was a temporary fall, remained much the same as at Eleusis in 329. Clothes also seem to vary very little, though our information is too meagre to argue from. But the rise in the cost of food and housing was great.

I take food first; and the most important food to the working man was corn. Now at Delos barley was normally about half the price of wheat, and a man when paid in kind was given indifferently either so much wheat or double the amount of barley, so I may calculate in wheat only. Demosthenes says that prior to the famine of 329 the normal or regular price of wheat at Athens was five drachmae the bushel, which may serve as a base-line ; for both Athens and Delos imported wheat by sea. Taking the year's average, in 282 wheat at Delos was 7 dr. 3 obols the bushel (it touched 10 drachmae) ; in 258 it was 6 dr. 4 obols; in 250 it was 5 dr. 4 obols. We have no figures round about 300; but as the farm rents must bear some relation to the price of wheat, then, looking at the money curve, I should expect wheat about 300 to average ten drachmae ; and it was possibly about this time that barley at Lampsacus was 6 drachmae, which would be TO to 12 drachmae for wheat. However, we see that by 250 wheat had not yet got back to the basic figure, any more than farm rents had ; and in fact, more than half a century later the established official price at Samos was still somewhat over the basic figure, 5 dr. 2 obols. But if the working man was badly off with the price of wheat, he was still worse off for oil, one of the few absolute necessities of the very poorest, as Menander says, for they had no other fats. In the early fourth century oil was 12 drachmae the metretes. At Delos, about 305, it averaged ^2 drachmae ; in 302 it was 45. By 281 it had fallen to 36, and from 269 to 250 it fiiuctuates between 20 and 1 6 ; that is, like wheat, it had still not got back to the old price. Common

wine was much the same ; Demosthenes gives 4 dr. the metretes as the normal price, while at Delos it fluctuates between 10 and ii|^. Housing was even worse than food. (After the first quarter of the third century the working population at Delos was fast increasing ; so I assume that, if better houses rise in value, poorer ones rose also.) 1 have taken out the average rent of a house for the houses belonging to the temple (the lettings vary in number, so totals are useless). Early in the fourth

century the average annual rentwas certainly not over 20 dr. and was probably nearer 10. Unfortunately there are no figures about30o;butin282theaverage is 38, at least double. In 279 it is 61, from which it rises steadily to 73 in 250, that is, four or five times the figure before Alexander. The rents are already going against the general price curve, rising while money is rising, because people had already begun to flock into Delos. In 246 there was a house famine, and the figure jumps to 125 ; in 219 it is 73 again, and thence rises again to over 100 in the early second century. The point is, that if working men came to Delos for work with housing in that state, what were the general conditions like in the places they came from.''

We nowcome to the important question of wages. Looking at the great rise in the price of food and housing in the first part of the third century, wages ought to have risen considerably. For in the time before Alexander wages had done so. Wheat had risen fromthreedrachmaeabushel in Socrates' time to five drachmae in Demosthenes'; but wages had risen even more ; at the end of the fifth century a skilled artisan at Athens got a drachma a day, at Delphi

about 339 he was getting, in Athenian currency, about 8 J obols, at Eleusis in 329 he generally got 2-| drachmae — 15 obols. But after Alexander we find that the wages at Delos, instead of rising with rising prices, actually fall. We need a base-line for comparison, the level of bare subsistence, and fortunately this is not in doubt ; two obols a day for one man, or 120 drachmae the year of 360 days. This was the slave rate, the pauper rate — Menander makes a young man call it a starvation rate ; it was what Athens in the late fourth and the third centuries paid to the crippled who could not work, what Delos paid to the temple slaves and the flute-girls, and what Demosthenes had calculated would do for patriotic Athenian troops if they forewent their pay. A man needed one choenix of wheat a day, that is, 7^ bushels (medimnoi) a year : and as we know from the Delos accounts that a working-man's opson — that is, all food except bread — was reckoned at the equivalent in money of his bread, then with wheat at the basic price of five drachmae the man's bare food would cost 75 drachmae a year. We can calculate from the Eleusis and Delos accounts

that 15 drachmae a year would do for clothes, if an outfit lasted three years and he had no change of clothing; that leaves the man, out of his 120 drachmae, 30 for housing, fuel, and everything else ; that is, two obols a day was just bare existence. For a small family, wife and two children, the line of bare subsistence was probably three times this, a drachma a day or 360 drachmae a year; I may quote a law of Ilium of about 280, whereby a slave, if he murders a tyrant of the city, is to get a drachma a day for life, that is, he shall not have

to work for his family. Now to apply these standards — two obols for a man, i drachma for a family — to what we learn about Delos.

First, the daily wage of skilled artisans. At Eleusis in 329 they generally got 2-| drachmae a day. At Delos they practically always get two drachmae. This is a considerable fall ; still, on the face of it, two drachmae looks comfortable. The reality was very different. It was two drachmae a day when employed, and the employment was merely irregular jobs. (It was no doubt the same at Athens; in one of the broken Erechtheum accounts some named workers seem only to work for a few days in the prytany of 30 days.) I have taken out a few figures for Delos. In 302, a worker called Olympos, who gets more jobs than anyone else, makes not much over 200 drachmae in the year, — let us be liberal and call it 240 — that is, four obols a day, not enough for a family with wheat at five drachmae, and wheat was probably nearer 10. In 279 we have complete figures; I take the most prominent workpeople. Theodemos the carpenter makes 106 drachmae in the year, not enough to keep himself. Nicon the mason, who had come from Syros to better himself, makes 187 drachmae ; he might just maintain a wife. Dexios the black-smith only makes 54I drachmae. A blacksmith would get some work on the farms ; but the other two would not get much work apart from the temple. Now this is the real point here — could they get much other work or not } — and so I give the proof that they could not, which is due to Professor Glotz of Paris. In 282 the temple en-gaged two skilled masons, Leptines and Bacchios,

by the year, not by the day, and paid them partly in kind; but by 279, consequent on a temporary famine in 281, when wheat went to 12 drachmae as the year's average, the temple had thrown the risk on the two workmen and had commuted their pay to a money payment totalling altogether 240 drachmae a year each, with an occasional small allowance for clothes — 17 drachmae in 279, nothing in 278. These men would earn two drachmae a day, and 360 days at two drachmae would be 720 drachmae — what the architects got ; but these masons are content, for the sake of a permanent engagement by the year, to take exactly one-third of this, 240 drachmae a year or four obols a day — just about what Olympos did make in 302 ; this shows they could not count on getting outside jobs. The two drachmae a day of the skilled artisan on intermittent jobwork then really means, at best, four obols a day by the year ; and this seems to be what Ptolemy III paid to the masons whom he sent to Rhodes after the great earthquake. How did four obols work out for a married man in 279, with wheat at (say) about 7 drachmae ? His own food would cost 105 drachmae ; his wife's, say two-thirds, 70 drachmae. Suppose he was given his clothes, and his wife's only cost 10 drachmae a year. That leaves §^ drachmae for housing, fuel, and all other expenses, including feeding and clothing his children. That family must have gone very short indeed ; still, they had a certainty ; they could live somehow or other.

But how did it stand with the great majority who were not engaged by the year ? (Remember 1 am taking the best paid cases.) I will give one

illustration, Dexios the blacksmith again. In 281 Dexios and another man undertake to sharpen all the tools of the workmen employed by the temple during the year at one obol apiece. Dexios' half of this is 144 tools at 24 drachmae. In 274 Dexios alone does all the tools at half an obol each ; the number has greatly increased, and he does 636 tools for ^2 drachmae. That is, in the course of seven years Dexios has come down to doing 4.^ times the work for 2^ times the wages. It shows how desperately in need he was of that extra 29

drachmae.

Now to look at the unskilled men. In 329, at Eleusis,theygetnineobolsaday on jobwork. In 279 atDelos the pay ranges from eight to five obols,but a laterfragmentshowsthatonedrachmawas the normal pay on jobwork, even for the semi-skilled, so I take one drachma as the average, a considerable fall from nine obols to six. But, if two drachmae on job-work really meant, as we have seen, only four obols a day by the year, one drachma on the same work was really two obols a day by the year ; that is, the bare subsistence line for a single man, the pauper and slave rate. At Delos then one can speak with some confidence on a much controverted question ; slave labour ha^ dragged unskilled free labour down to its own level. Indeed it sometimes falls lower still, well below the slave rate, though the slave rate it-self had fallen ; the temple slaves at Eleusis got three obols a day against the two obols at Delos ; still even at Delos three obols occurs occasionally, ap-parently after long service. But I can give two instances of free labour at a rate well belowtwo obols a day per year. In 301, Tlesis, a skilled plasterer,

takes on a job for a lump sumof 140 drachmae, which at the usual two drachmae a day means 70 days' work. The temple gives him two labourers to bring sand for him and make and mix his plaster, and pays each of them 30 drachmae for the job, slightly over 2^ obols a day for jobwork instead of a drachma ; and wheat may have been 10 drachmae at the time. Those two labourers lived on barley-bread and water, and not too much bread. In 282 the temple em-ployed a woman called Artemisia, not a slave, to do baking, paying her monthly. Herwages for seven months are less than an obol a day ; one hopes she was only working for pocket-money. It may be worth mentioning here that the only strike I know of prior to the Roman period was an attempted strike of bakers, at Paros.

We see then that in the first half of the third century the daily wage for both skilled and unskilled labour had fallen considerably since Demothenes' time, though the price of necessities had risen. The same seems true, generally speaking, of piecework. The bulk of the work at Delos, as in all the temple accounts we have, was piecework ;

but it is too complicated a problem to discuss now, and I can only say that it is supposed to have aggravated the fall in daily wages ; certainly some piecework wages fall between 300 and 250. I can however give one set of figures which stands by itself, the cost of cutting the accounts on the actual stones ; but I have to omit any Athenian figures, as Athens paid on some totally different system. (For convenience of comparison with Delos I have turned Aeginetan currency into Athenian throughout.) Early in the fourth century, at Epidaurus, the

tariff per loo letters cut was usually nine obols ; 1 1 obols and eight obols do both occur, but seem exceptional prices for small pieces of work. At Delphi in 339 the tariff is 8 J obols the lOO, but in 335 it has fallen to just under six obols. At Delos in 302 it is still six obols,one drachma, per 100 ; but later in the year 130 letters are cut for a drachma. In 301 there is a further heavy fall, that is, far more letters are cut for a drachma; and by 282 we find a well-established tariff of 300 letters for a drachma — two obols the 100 — which continues into the second century, and is found then both at Delos and at Lebadea. In 250 an attempt was even made at Delos to get 350 letters cut for a drachma, but it led to bad work, and was apparently given up. Omitting the exceptional extremes, this means that in the course of the century prior to 282 the tariff fell from nine obols to two obols the 100, while most of the time prices were rising and money falling in value. These startling figures more than bear out the deductions I have drawn from the daily wages.

The position of the working man in the third century at Delos was then a very bad one ; the unskilled easily fall below the bare level of subsistence, and the skiUed are very hard put to it to bring up even one or two children. Yet Delos was a bright spot; by 279 certainly, and probably earlier, workmen were going there from other parts of Greece, especially from the islands, which means that their conditions at home were worse. As we have seen something of the property of the upper class in the islands, the deduction is that, so far as the island world can inform us, the third century on the social

side was getting into a very unhealthy state ; the poor were getting poorer, and the gap between rich and poor was widening. We have seen that from 400 to 329 wages rose with the rise in prices ; after Alexander's time wages seem to lose all relation to prices, and fall while prices still rise. The fact seems certain ; but I have no explanation to offer beyond unrestrained competition, unless the great wars of the Successors had driven men a little mad. It was not I think Asiatic competition ; we do not meet Asiatic workmen at Delos much before 250. But it was competition with little to temper it. There were no workmen's organizations in our sense ; associations of men in particular trades are just beginning to appear, but they were only social and religious bodies, which at best might help an oppressed member or give him a decent funeral. Except I think at Athens and Rhodes, state aid was only given during a siege or a famine ; and even at Athens it was confined to men definitely crippled. Rhodes later on apparently had a wonderful system of food liturgies, under which wealthy individuals undertook to look after a certain number of poor, perhaps the reason why Rhodes never had any trouble ; but it is uncertain when the system started. Philanthropy, in our sense, is a very rare phenomenon ; rich men were often liberal, but only to the State. A feeling of humanity was certainly growing, as exhibited in the increase of arbitration, the movement for making whole cities asylums, the habit of manumitting slaves by will, and the dislike of selling free captives ; but this had nothing specifically to do with the poor. A copy-book maxim of the time says "Pity slaves";

but as to free men, though we often hear in literature that poverty is hateful — an anonymous fragment of verse says "his own mother hates a poor man' ' — there seems to be only one doubtful reference ; to poverty, prior to Cercidas, as a matter for compassion. When the Stoic Cleanthes, in his Hymn to Zeus, says "that which is dear to none other is dear unto thee," he may mean the poor and unfortunate ; but, even if he does, he leaves the matter to Zeus ; he does not suggest that it is any concern of other men.

What we get then is, more visible luxury among I the rich; high prices and falling wages for the ; poor ; and hardly any shock-absorbers in the social j system. These are conditions which lead to trouble ; and in fact if things got too bad there was only one known resource, revolution ; not political revolution, but social revolution ; a rising of the "have-nots" against the "haves, "to the cry of division of the land and cancellation of debts. Debt in fact was often at the bottom of the whole business. Praxicles may well have expressed his fear of revolu- tion in his mortgage deed ; for troubles between creditors and debtors were common enough in the islands. Between about 280 and 250 we know of at least four outbreaks of the kind in the islands, in Naxos, Amorgos, Ceos, and Syros — one at least is expressly called a matter between poor and rich ; and in every case the trouble was bad enough to compel the suzerain power — Egypt or Mace- donia— to intervene in order to settle what was probably incipient revolution. But indeed revolution had long been the general fear of the well-to-do ; at Athens the jurymen had for centuries taken an i

1 oath not to vote for division of land or cancellation I of debts ; the threat colours many passages in 1 Aristotle ; Isocrates had said bluntly that men I feared their fellow-citizens more than a foreign enemy. But with the advent of Macedonia, pre- cautions had been substituted for fears. In the treaties made in 335 between Alexander and the States of the League of Corinth it was provided that the Council of the League and Alexander's representative were to see to it that in no city of the League should there be either confiscation of personal property, or division of land, or cancellation of debt, or liberation of slaves for the purpose of revolution. We have here both the complete pro- gramme of the social revolution under four heads, and an interstate guarantee against it ; if revolution breaks out in any city it is to be repressed by the full force of Macedonia and the Panhellenic League. Demetrius' League of 303, which was a close copy of Alexander's, must have had a similar arrange- ment; for since 335 conditions had become much worse, and it was probably only the enormous de- mand for mercenaries, with opportunities of plunder, which tided the Greek world over the economic crisis round about 300. When the social revolution

broke out in Cassandreia about 279 this opportunity was already becoming limited ; and it was still more limited when in 223 Antigonus Doson of Macedonia formed the third of the Panhellenic Leagues to crush a particular revolution, that at Sparta.

Sparta offers us a picture of the three regular phases of a revolution; drastic reform, moderate or limited revolution, and complete revolution, all within the compass of about one generation. The

Story is of interest from many sides, personal, military, political, and above all philosophical ; but I must confine myself as far as I can to the social aspect. While those writers who were enemies of the movement, Aratus and Polybius, give us much political and military information, it happens that our social information is largely drawn from a convinced friend of the revolution, the contemporary historian Phylarchus, represented for us by Plutarch's Lives of Agis and Cleomenes. Phylarchus was a powerful and dramatic writer, but an out-and-out partisan and untrustworthy over figures ; and people once used to doubt his gloomy picture of Sparta in 244, when the young king Agis IV came to the throne. There can however be little question now that that picture is substantially true. He represents the citizen body as enormously reduced, all the land in the hands of a small class of wealthy men, too much property owned by women, and a large number of poor men who had lost their land and consequently, under the Spartan constitution, their citizenship ; the common meals had become a farce, as the rich would not, and the poor could not, take part in them ; and both landowners ; and poor were weighed down by debts. Now, except for the common meals and the debts, this is exactly the picture Aristotle had drawn nearly a century earlier, only the process had gone a little further. One can trace what had happened. The : Spartans in Plato's time had been enormously rich in gold and silver, the plunder of war. Since then all their wars at home had been unsuccessful, but against that many Spartans in the fourth century had made money by military service in Asia and

Egypt. There was practically no outlet for money at Sparta itself in commerce or manufactures, so those who owned what remained of all this wealth had invested it in buying up land ; this, joined to the loss of Messenia, had rendered a large class landless, and the only wealthy people were the large land-owners, unless a few metics. But whereas in the fourth century Sparta had always recovered from defeat, a new thing had happened ; she had not recovered from her great defeat by Antigonus Gonatas in 265, for soon afterwards Megalopolis could and did defeat her single-handed; so Phylarchus must be quite right about the enormous reduction in citizens. Then as to debts. Some landowners were still rich in gold, but others were not ; there were two classes, as we shall see, and the latter class had heavily mortgaged their lands in order to live up to the prevailing standard of luxury. One recalls here that, even at Athens, Menander had called a man whose land was not mortgaged very lucky, and that at Ephesus after 297 the heavy mortgages had led to a suspension of the ordinary law ; again we have no reason to doubt Phylarchus. As to the poor being burdened with debt, how could anything else possibly happen, looking at the condition of things we saw at Delos .'' Even at Delos the temple throughout the third century keeps on making an increasing number of bad debts for small amounts, and 1 have already mentioned the troubles in the islands over debt; but the best commentary on Phylarchus is Menander's play The Heroy where the supposed son and daughter of a poor man go out voluntarily as slaves to work off a debt which is only 200 drachmae. In

fact, Menander defines a well-to-do man as "one who can live without borrowing." What we see then at Sparta is what we saw in the islands, only more markedly so ; the gulf between rich and poor has widened ; the rich may not be richer, but the poor are much poorer. And as there was practically no middle class at Sparta, the class which Aristotle called the best safeguard against revolution, Sparta was obviously ripe for a change.

But during the fourth and third centuries there had grown up a belief that long ago Sparta had been

a very different place ; that Spartans had once owned no personal property but their weapons, and that their traditional lawgiver Lycurgus had divided the land equally among all Spartan citizens, who held it in equal lots; these lots had not exactly been the private property of their owners, but had been allotted to them by the State in order to enable them (since the lots were cultivated by Helots) to devote their time unhampered to the real business of the State, military training; just as a Spartan's body was not exactly his own, but in a sense belonged to the State, so did his land. The present state of things was regarded as a backsliding from this former ideal state. Of course this ideal state had never existed ; there had always been rich and poor at Sparta, and there had never been, in historical times, an equal division of the land. But the idea was none the less powerful because it was really a product of philosophic speculations about communism. For the Stoics were teaching the equality of all men, and Zeno and lambulus had constructed Utopias in which there were neither rich nor poor ; and lambulus is careful to explain

9 — z

that his people, having abolished classes, were dcrracnacrTOL, free from revolutionary troubles.

Now the poor in a Greek state had little chance of making a change constitutionally, and were badly off for weapons; they rather depended on a lead from some individual who was not one of themselves, and possessed some force, for instance mercenaries ; this had been the case for example in the social revolution at Cassandreia, which had ended in a tyranny. By 244 the mixed Spartan constitution had become an oligarchy, and the ephors now ruled in the interest of the rich ; hence the poor naturally looked for help to the kings. It is perfectly possible that Agis was partly a saint, as Phylarchus draws him — Plato's philosopher-king, inspired by Stoic teaching and the third century Utopias to create a new world of equality and brotherhood; and he may have had real sympathy for the poor. Probably he also had military ambition ; for the military allotment, the KXrjpos, might be as potent a source of military strength to Sparta as it had been to the Hellenistic monarchies. But he was above all a Spartan patriot;

he desired, without altering the political constitution, to restore what he believed to have been the golden age of Sparta by dividing the land equally into lots, so that all landless men should again receive allotments, and the common meals could be restored. But as he could not distribute mortgaged land, or usefully give allotments to poor men weighed down with debt, he had at the same time to envisage the cancellation of all debts, the State having no money to pay them ; and so this very conservative reformer in fact adopted two of the main principles of the social revolution, division of

land and cancellation of debt. (The Greeks of course hardly took our view of private debts ; law-courts always favoured the debtor, and it is said that more than once debts had been discharged, even in mercantile Corinth, by the elementary process of killing the creditors.) As to the other two items in the full revolutionary programme, naturally Agis never considered freeing the Helots, who were a necessary part of the Lycurgan institutions — even the Stoics had never advocated abolition; and it is supposed that he did not mean to take personal property for the State. But he gave his own large fortune to the State, and hoped others would follow.

Though Agis thought he was going to restore an old state of things, he was really attempting quite a new one. But in a little country like Sparta, an equal division of the land, with a periodical redistribution, should have been perfectly feasible ; one Greek community, the Liparaeans, did actually carry out such a redistribution every 20 years, treating the occupation of land as usufruct and not ownership. But as land at Sparta had in fact been private property for centuries, one can hardly blame the landowners for not suddenly becoming unselfish altruists merely because of a vague belief that once upon a time the State had had certain rights in the land. Whether Agis was justified in proposing to take their land for the good of the community is a matter on which I express no opinion ; we are doing much the same thing, but more gradually, by means of the death duties. His actual proposal was to divide the land in the inner ring, about Sparta, into 4500 Spartan lots, and

that in the outer ring into 1 5,000 lots for Perioeci ; as there were nothing like 4500 Spartans, he proposed to fill up the number from Perioeci and selected metics in sympathy with Spartan institutions. One can see from the allusion to this in Teles' discourse On Exiky spoken at Megara two years after Agis' death, the great interest these proposals created.

The poor supported Agis heartily, with some of the young men, who caught the inspiration of youth. The only way to interpret what happened is to suppose that the landowners were divided into two parties. The wealthy, led by the other king Leonidas, were uncompromisingly hostile ; many of them would be creditors. But those whose lands were mortgaged, led by Agis' uncle Agesilaus, the villain of the piece, thought they could make use of Agis to free their lands from debt. They first supported him ; then, having captured the ephorate, they were able to prevent him carrying out both his proposals together, as he wished, and got debts abolished first, as they wished. They now had no further use for Agis; they sent him north with the army, and proceeded to undermine his position with the poor, who were disappointed at not getting the promised land; and when Agis returned, he found himself faced by the fact that he must use force or fail. He decided not to use force. Probably he could not trust the army; but it is quite possible that he deliberately preferred to die rather than kill his fellow-citizens. He took sanctuary, was captured by a trick, and murdered; and for a time Leonidas and the reaction triumphed.

Thirteen years later Agis' plans were taken up

afresh by Leonidas' son Cleomenes, who had become king ; he was a pupil of the Stoic Sphairos, and had married Agis' widow, and the two had converted him to Agis' views. He was a stronger and harder character than Agis, and not so single-minded ; and it weighed heavily with him that the reforms would greatly strengthen Sparta for war, for he was extremely ambitious. He saw clearly why Agis

had failed ; and though his aim was exactly the same, the restoration of the supposed Lycurgan institutions, one calls him a revolutionary and not a reformer because he saw that, to succeed, he must first overthow the existing political constitution and overthrow it by force. All the Peloponnese except Elis, Messene and Sparta was now in the Achaean League, whose leading man was Aratus of Sicyon, a very clever, wealthy, and unprincipled statesman. Cleomenes began by picking a quarrel with the League and forcing Aratus to declare war ; Phylarchus says he brought on the war simply to pave the way for his revolution, and the opposition writers, Aratus himself and Polybius, do not deny this. The war enabled Cleomenes to enlist mercenaries. When he was ready, he left the citizen troops in camp at a distance from Sparta, returned to Sparta with the mercenaries alone, turned out the ephors, killing four of them and ten of their supporters, exiled 80 others, and was sole master of Sparta with the loss of 14 lives. He then cancelled all debts, and divided the land very much as Agis had proposed ; he also abolished the ephorate. In dividing the land, he set aside allotments for the 80 exiles, whom he meant to recall later. It shows that there was a touch of Alexander about

Cleomenes ; no one else had thought of recalling his political opponents.

Had Cleomenes stopped there ; had he been content to make peace with Aratus and confine himself to the internal development of Sparta; one does not see what could have prevented his revolution being a permanent success. Sparta, which after Agis' death had been too weak to prevent even an Aetolian raid, had become at one stroke far too strong for any Greek state to attack ; beside mercenaries, Cleomenes could put 14,000 to 15,000 Lacedaemonians into the field, as against the traditional 6000 of the fourth century. Unfortunately for Sparta, his ambition came into play ; he wanted to be head of the Peloponnese, perhaps of Greece, and play Alexander in a new League of Corinth. He began by thoroughly defeating the Achaeans, and might have been elected head of the Achaean League had he not fallen ill just before the Achaean assembly met. Aratus tided over that danger; but what he could not tide over was that in

several cities there had been a rising or revolution of the poorer classes which carried the city over to Cleomenes. The Achaean League was a most respectable institution, but it was based on the power of the well-to-do ; and Aratus, who was terrified of social revolution, began to negotiate with Antigonus Doson of Macedonia for help to repress it. But as soon as this was known, Cleomenes swept the country ; there were risings in many cities, including Argos and Corinth, and soon the Achaean League held nothing but Megalopolis and Sicyon, and even lost part of Achaea itself. It was a wave of revolutionary enthusiasm such as Greece had

never seen ; and Aratus, with his back to the wall, agreed to pay Antigonus' price, the cession of Corinth. Antigonus thereon formed a Greek League whose first object was to suppress the revolution; this follows from the fact that he gave out that he was not at war with Sparta but only with Cleomenes.

Probably we can now give one concrete instance of how Cleomenes' revolution affected other cities ; that is the extraordinary little poem on wealth and poverty written by Cercidas. The writer is certainly the Cercidas who belonged to the governing class at Megalopolis and was a personal friend of Aratus ; and Megalopolis was as hostile to Sparta as one city could be to another. And in face of this, Cercidas writes a poem questioning the justice of the gods in making some worthless men rich and better men poor, and then, turning to his own class in Megalopolis, declares that there is ■ only one way for him and them; they must heal the sick and give to the poor while they have the chance, for, if not, their wealth may be taken away — the social revolution may be upon them. That a Greek politician of the upper classes should be advocating charity and philanthropy, even if only tentatively, even if partly perhaps through fear, is a most amazing phenomenon. Nothing came of it ; for again Cleomenes' ambition drove Cercidas back into Aratus' arms.

And in fact Cleomenes' cause was lost, at the height of its success, before Antigonus intervened. That sweeping success had been largely due to the belief of the common people throughout the

Peloponnese that he had come to give them the

longed-for social revolution — land for everybody and no debts ; what he had done at Sparta he would do elsewhere ; there was going to be a new world. This was the last thing Cleomenes meant to do ; he was a Spartan king, and had no idea of raising a whirlwind which might sweep himself away. It had already become clear, before Antigonus arrived, that Cleomenes was not going to introduce a general revolution; and the lower classes were ready to leave him and return to bearing the ills they knew of. Consequently, when Aratus managed to slip a few troops into Argos behind Cleomenes' back — he was at the Isthmus — Argos changed sides ; and Cleomenes, with his communications threatened, had to quit the Isthmus and retreat to cover Sparta, while city after city fell away. He had suffered the usual fate of the moderate revolutionary, and antagonized both parties, both the well-to-do and the poor, the one because he went too far, the other because he did not go far enough. The rest is only fighting; he had his revenge on Megalopolis, but was defeated by Antigonus at Sellasia and fled to Egypt, perhaps the only king of Sparta who ever survived a great defeat ; and I know nothing in later Greek literature sadder than the speech in which Plutarch makes him justify his choice between his duty to die and his duty to live for Sparta and the revolution.

Antigonus restored the old regime at Sparta, and many of Cleomenes' new citizens lost their land again. But his party was not destroyed; and the city led an unsettled existence for 14 years, with an increasing number of exiles, till in 207 it

was badly defeated by the Achaeans. Thereon the real revolution, which must long have been smouldering, broke out under the lead of a man called Nabis. All we know about Nabis comes from his bitter enemies. He may have been as cruel as Polybius says he was — though Polybius himself could advocate torture with anybody — and his mercenaries may have been the scum of the

earth; but one must look fairly at what he did. He carried out all the four points of the social revolution ; he not only abolished debts and redistributed the land, but he took all the money he could get from the well-to-do, many of whom he exiled, and freed slaves; part of his army was composed of liberated Helots. When Argos was given to him by Philip V, he apparently carried out the social revolution there in much the same way. But he professed that the money which he exacted from the rich was taken "for the common expenses of the State," and it seems possible that the State now paid for the common meals, as was done in Crete ; and Polybius in a later book accidentally shows that he left the wives and daughters of the exiles in undisturbed possession of a certain amount of land. Certainly in getting rid of the class state, as he claimed to have done, and substituting one in which all were equal, he for the last time restored Sparta's strength in an extraordinary manner. In spite of her terrible losses by war and exile, he raised 10,000 citizen troops, partly liberated Helots, and with mercenaries and 2000 Argives — evidently he could trust the lower classes at Argos — he had in Sparta 18,000 men when Rome declared war on him; and when Flamininus,

the conqueror of Macedonia, attacked Sparta with 50,000 men, they beat him off. One can see that they must have fought for some sort of an idea, anyhow. Certainly Nabis lost his nerve and accepted Flamininus' terms next day ; but though he lost Argos and the coast, Flamininus made no attempt to alter anything in Sparta itself, or restore the exiles. When Nabis was assassinated by the Aetolians, the people rose and avenged him; and when the chaos after his death ended in Philopoemen joining Sparta to the Achaean League, recalling the exiles, and brutally abolishing the peculiar Spartan training and institutions, 30ooof Nabis' new citizens refused to go to Achaea with Philopoemen and preferred to take the consequences; Philopoemen sold them as slaves. So the revolution at Sparta finally ended as Polybius says that revolutions in Greece always did end, in the ruin of the community that made them. But that it did so end was due entirely to Cleomenes' ambition and to foreign enemies.

APPENDIX

Notes on the Lewis Collection
Corpus Christi College, Cambridge

The following are the most prominent objects in the Collection :

(i) A collection of 369 engraved gems, cameos and antique rlngs\ The following are of special interest :

A 5, A 6 (Aphrodite), A 10 (Eros), A 16 (Apollo), A 22 (Athene), A 26 (Italic warrior consulting the oracle of the woodpecker god PIcus), A 36 (young athlete ; copy of a Polykleltan statue?), A 48 (the Good Shepherd), B 46 (Nike of Samo-thrace?), B 78 (portrait head of a Lady of the Antonlne period), B 79 (Nero and Poppaea), B 80 (Hadrian), B 107 (chariot race), B 109-10 (Antloch of Eutychldes), C 17 (Gnostic amulet; Abraxas and the Khnoubis serpent), E i (a very early Crucifixion), G i (chalcedony phalera or boss from a Roman officer's breastplate).

(2) A bronze statuette of a girl, found at Grosseto in Etruria, but probably of Ionian Greek workman-ship. This is an archaic original, remarkable alike for excellence of workmanship and preservation, of the same class as the marble korai of the Acropolis of Athens, c. 500 b.c.

^ See J. H. Middleton, The Lewis Collection of Gems and Rings ^ with an introductory essay on Ancient Gems (Cambridge University Press, 1892).

(3) A mirror from Praeneste with incised decoration and early Latin inscriptions, the in-terpretation of which is uncertain owing to the abbreviations used.

(4) An archaic bronze figure of a youth originally forming the handle of a libation saucer (phiale).

(5) Bronze figures of Isis and Sarapis as human headed cobras with tails intertwined. Probably from Cyzicus. Formerly in the Nordtmann Col-

lection, Constantinople, and frequently published.

(6) Silver-gilt figure of a goddess combining the attributes of Isis, Tyche ("Good Luck"), Nemesis ("Poetic Justice"), the Sun and Moon, and various other divinities, forming a compendium of popular religion, third century a.d.

(7) Corinthian mirror case with repouss6 relief, Dionysus, Eros and girl playing the lyre, fourth century b.c.

(8) A collection of objects illustrating ancient domestic life, etc.; weights, standard coins, domestic utensils, articles of the toilet, etc., among them a large series of lamps, Greek, Roman and early Christian, showing the evolution of the terracotta lamp from the fifth century b.c. to the fifth century A.D. Note the specimens of early imperial date with representations of gladiators, a chariot race, an animal trainer, "Tityrus" (so inscribed) from Virgil's first Eclogue, with his sheep and goats, and various mythological subjects.

(9) A splendid Attic red-figured kylix of the time of the Persian wars (480 b.c.) with symposium scenes inside and out. Probably by the same

painter as the famous kylix in Berlin, with representations of a bronze statue caster's workshop (foundry). Formerly in the Lecuyer Collection.

(10) A kotyle of the same date with a goddess running off with a youth from a musical party; probably Eos and Tithonus are intended, but elsewhere Eos is nearly always shown as winged. This and the last-mentioned vase are specially remarkable for their perfect preservation.

(11) A late red-figured stemless kylix (late fifth century), with a unique representation of the severed head of Orpheus giving vent to oracular utterances, which are taken down by a youth with stilus and tablets, under the inspiration of Apollo. Formerly in the Barone Collection at Naples and frequently published, e.g. in Miss Harrison's Prolegomena to the Study of Greek Religion.

(12) A large amphora {c. 450 B.C.); Ajax dragging away Cassandra from the statue of Athene, while Athene herself appears to intervene, a most unusual feature in representations of the subject. Formerly in the Barre Collection, Paris.

(13) A black-figured "Panathenaic Amphora," given to a victorious pankratiast in the games at Athens (early fifth century b.c).

(14) A primitive multiple vase ("kerchnos") from Melos, probably intended for first-fruit offerings, each compartment holding a sample of a different produce.

(15) A blue fafence jug bearing the name of King Ptolemy Philopator (222-205 ^-^0 • this class of ware was made specially for use in temples

dedicated to deified members of the royal family of the Ptolemies.

(i6) A terracotta statuette of Aphrodite holding a bronze mirror, one of the most beautiful ancient terracottas known. From Myrina, Asia Minor.

(17) A type series of 344 Greek coins, selected from the main collection ; note especially the gold stater of King Croesus (i), the electrum tetradrachms of Cyzicus (5-7), the gold staters of Phihp of Macedonia (20-24), and Alexander the Great (25-27), and the fine series of late Attic tetradrachms with magistrates' names (89-94). (The remaining Greek coins can be seen on application to the Curator.)

(18) 296 selected Roman coins; note especially the splendid series of imperial gold and "first bronze," most of them in the most perfect condition. The following reverses are of special interest: 107 (Vespasian: temple of Vesta), 113 (Trajan: arch of Trajan), 224 (Caligula: sacrifice before the temple of "divine Augustus"), 227 (Claudius : "Spes," an archaic figure resembling the Grosseto statuette), 236 (Nero : the harbour at Ostia), 247 (Titus: the Colosseum), 258 (Trajan: the temple in the forum of Trajan), 267 (Hadrian : the earliest representation of Britannia,

cf. 279–80, two medallions of Commodus), 283 (Severus sacrificing to Hercules at the secular games).

Several of the above are of special value as aids to the restoration of the buildings of ancient Rome.

(19) A selection of Jewish coins including the

silver shekels and half-shekels probably struck by the Jews during the great rebellion of 66–70 a.d.; the shekel dated "year 5" (70 a.d.) was the first of its date to be discovered and has been many times published.

(20) A selection of English and French gold coins and English silver from the time of the ancient Gauls and Britons to Queen Victoria.

SUMERIAN MERCHANTS AND THE PROBLEM OF PROFIT

By MARVIN A. POWELL

The theory that the Sumerian economy was controlled by the state or temple has until recently been a premise generally accepted by those who have attempted to deal with economic activity in the third millennium B.C.[1] This theory has necessarily had a profound effect upon the interpretation of the role of the merchant in this period of Mesopotamian history. Since our evidence is by no means sufficient to reconstruct merchant activity in detail, our view of this aspect of Mesopotamian economic life is decisively conditioned by our theory of the total economy. For this reason, I have sketched out in what follows the theoretical basis which underlies the position taken in the present paper, as well as my understanding of the theoretical position to which it stands opposed.[2]

During the 1920's, Anton Deimel reconstructed, on the basis of surviving tablets available to him, the basic structure of the archive of Bau in Girsu during the administrations of Lugalanda and Uru'inimgina (UruKAgina). Operating with the evidence assembled by Deimel, and taking his rather tentative deductions to what seemed at the time to be the logical conclusion, Anna Schneider and others arrived at a view of Sumerian society in which the temple functioned as the heart and brain of the whole. In the context of such a view, which for many years has affected both Assyriological and popular literature on the subject, the merchant can hardly be interpreted otherwise than as an employee of that central controlling agency. Thus, the economy of the third millennium tended to be categorized under such rubrics as " theocracy " and " statism ". The economy of this era was contrasted with the " capitalism " of the Old Babylonian period, and the differences between the economy reflected in the documents of the two eras were often assigned to the influx of new Semitic peoples, a classic case of explaining unknowns by another unknown or, perhaps, of the uncritical generalization of some specific Semitic stereotype such as the Carthaginian in Plautus' *Poenulus*.

Within a decade of the appearance of Anna Schneider's formulation of Deimel's data, Th. Jacobsen and I. M. Diakonoff independently remarked that this model of

[1] This paper is written as a general formulation of economic facts as they pertain to the motives underlying merchant activity. Documentation has been kept to a minimum, both to save space and because the specialist capable of dealing with the documents will not need it anyway. However, in fairness to my readers and to other scholars whose unpublished manuscripts I have read, I should state that part of the theories offered here owes its stimulus to papers by Tom B. Jones (*Jacobsen Festschrift*), Gordon Young and Richard Nelson (*Jones Festschrift*), Daniel Snell's dissertation " Ledgers and Prices: Ur III Silver Balanced Accounts " (Yale Univ., 1975), and Nels Førde's revised monograph " The Sumerian Merchants of the Ur III Dynasty " (dated 1975). I am indebted to my Northern Illinois University colleagues, Thomas Blomquist and George Spencer, for discussing with me the problems of merchants in medieval Europe and India respectively, and finally, without implying in any way that they agree with my point of view, for discussing these and related matters with me: to I. M. Diakonoff, Claus Wilcke, and Hartmut Waetzoldt.

[2] Full documentation for these theories will be found in my paper " Götter, Könige und ' Kapitalisten ' in Mesopotamien des 3. Jahrtausends v.u.Z." (*Oikumene*, Budapest, *c.* 1977).

Sumerian state and society did not accord with the evidence from Sumerian and Akkadian literature. Jacobsen's paper, " Primitive Democracy in Ancient Mesopotamia ", published in 1943, was the first systematic presentation of the literary evidence. Diakonoff, and later on I. J. Gelb, elaborated on these criticisms, drawing on other types of written records. From these criticisms has emerged a school of thought which stands in opposition to the older theory of temple or state economy. Fundamental to this school of thought is the assumption that an economically significant portion of the economy was not under the control of the temple or state. How this portion of the economy is denominated is unimportant. One may assume that it corresponded in a general way to what we call " private property ", subject as always to the social rules governing the use of such property.

This view of Mesopotamian economy in the third millennium requires a reappraisal of the role of the merchant in the economy, as well as of the motives underlying his economic activity. The basic premise underlying the conception of the merchant presented here is that the merchant operated *primarily* on the basis of profit and loss and that the state or temple *never* undertook systematically to underwrite his losses. The evidence for this, like the evidence for everything else in the third millennium is disparate, uneven, and indirect, but, on the whole, it is far more compelling than the evidence which can be brought forward to support the view that profit was not an important motive in merchant activity. At the same time, it cannot be too strongly emphasized that " important motive " does not imply " sole motive ", because we are often unable to determine the motives in contemporary economic activity, not to speak of ancient or medieval times.

What evidence is there, then, that Sumerian moral values fostered or even tolerated merchant activity arising from the profit motive? The evidence from Sumerian literature is ambiguous in the sense that a statement to the effect that " the business of the merchant is to make money " is nowhere to be found. A large portion of Sumerian literature is concerned with cultic affairs, and in literature of this type one will search in vain in most literatures of the world for direct evidence of economic activity. All that can be said is that Sumerian literature of this type is neutral in its implications. However, when one turns to other surviving genres one senses something akin to the economic motive under discussion. The literature of disputation lays great weight on the value of competition itself. Shepherd and Farmer, Summer and Winter, Bird and Fish, Tree and Reed, and others sing their own praises with a zest and confidence born of the love for contending, and this same spirit pervades the legendary-epic literature as well. It is true, of course, that anthropological research has discovered societies in which the spirit of competition exists without the profit motive, but the truth of the matter is that none of these anthropological models is particularly illuminating when applied to our problem, because ancient Mesopotamia constitutes a distinct paradigmatic model whose only close relative is ancient Egypt.

Nevertheless, let it be granted that the existence of a predilection for competition is insufficient to prove the existence of a profit motive. However, if one reads through the Sumerian proverb literature, one is struck by two salient facts: (1) how little it reflects the temple and state bureaucracies known from the ubiquitous administrative documents of the late third millennium; (2) the social values expressed therein clash

This content downloaded from 131.211.208.19 on Sun, 11 Aug 2013 20:46:43 PM
All use subject to JSTOR Terms and Conditions

with the assumption of a centrally organized economy in which each member of society, including the merchant, was essentially an employee of the central controlling authority. Even this is indirect evidence, but anyone who would deny to the Sumerians the blessed vice of venality will have to come to grips with the few proverbs that do mention merchants directly and which do seem to imply that the merchant's business was to make money. I am thinking particularly of the following two: dam-gàr-ra kug ta ba-an-ir, ù še ta ba-an-ir (precise meaning unclear) and uru^{ki} nam-bi nu-tar-re šassuk (šağ.TÙN)-bi dam-gàr-ra (a city whose fate is not to be decided: its registrar of deeds is a merchant).[3]

Turning now to the evidence of the archival records, which exceed in quantity all other types of written material deriving from the third millennium, one must bear in mind two fundamental points: (1) The overwhelming majority of all third-millennium records derive from the archives of great estates associated with the temple or central government. (2) Accounting on these estates is done purely from the standpoint of the estate itself. They are internal records which concern themselves with what takes place outside only insofar as it directly concerns the expenditure and income of the estate itself. Thus, the private profit or loss of persons doing business with the estate or even employed by it will be reflected in the archival records only when this profit or loss directly affects the income or expenditures of the accounting unit.

The bulk of documents of this type comes from various archives of the Ur III period. In fact, they are so numerous that one could almost be led to believe that nothing existed beyond the bureaucracy itself, until one reflects that it is the nature of bureaucracies to produce records and that contemporary bureaucracies the world over are still industriously engaged in essentially the same process that occupied Sumero-Akkadian bureaucrats some 4,000 years ago. One must constantly keep in mind that the essential life functions of those societies continue on, sometimes with the help of, not infrequently in spite of, and usually quite peripheral to the bureaucracy itself.

The group of documents which most clearly reflects merchant activity are the Ur III balanced accounts. The characteristic features of these accounts are well-known. They are divided into three basic sections: (1) *assets*, denoted by the phrase sag-NÍG.GA-ra-kam; (2) *expenditures*, which are enclosed by the two expressions šà-bi-ta ... zi-ga-àm, "out of this ... there was expended"; (3) *balance*, denoted by the expression lá-NI. The first and last of these call for brief comment. Without going into the complicated question of the precise reading of NÍG.GA and whether it has an etymological relationship to *makkūru* or *namkūru*, we can say with certainty that it has nothing to do with the verb ğar = *šakānu* and formally analyse the phrase sag-NÍG.GA-ra-kam as sag + NÌG.GA-r + ak + am = *rēš makkūri*, "head of goods" (= liquid capital, approximately) and illustrate the meaning of the phrase by the following diagram derived from the study of metrology.

[3] E. Gordon, *Sumerian Proverbs* (1959), 512 f., 1.165 and no. 1.67 (pp. 74, 460, 503).

All use subject to JSTOR Terms and Conditions

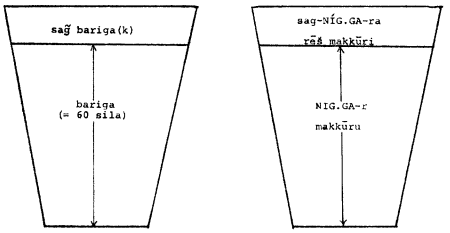

Fig. 1. Origin of the Term sag-NÍG.GA-ra.

Cf., e.g. L. Legrain, *TRU* 374: 12–15: sag ba-rí-ga 2:sila$_3$:ta.

The term lá-NI also derives from metrological usage, just as the term *balance* derives from Latin *bilanx*. The function and reading of NI in lá-NI remains problematic, since the term is attested for Presargonic Girsu in the form lá-a,[4] and the lexical evidence of Proto-Ea and Ea for a reading lá-u$_x$ does not strike me as compelling.[5] This, however, does not affect the interpretation of the term, which can have the meaning of both positive or negative balance. The origin of this usage is illustrated in Fig. 2.

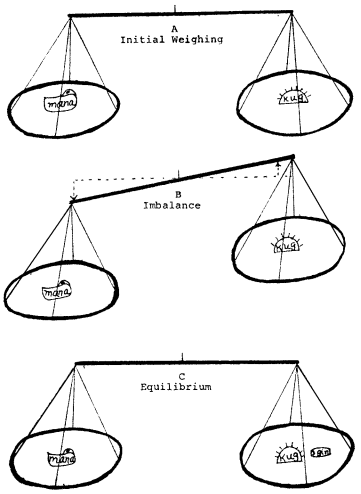

Fig. 2. Origin of the Term lá.

The process shown in A–C is called in Sumerian ki-lá tag. The 3 gin added in C is called lá-a, " that which creates a state of equilibrium ". The actual weight of the silver is called ki-lá and would normally be expressed in writing as 1 ma-na lá 3 gín, an expression also derived from this same process.

[4] References: J. Bauer, *AWL* (1967), 620, s.v. *lal-a*.

[5] I attempted to solve this problem in my dissertation, " Sumerian Numeration and Metrology " (Univ. of Minnesota, 1971; Univ. Microfilms, 1973), 139–149, but the results were inconclusive.

This content downloaded from 131.211.208.19 on Sun, 11 Aug 2013 20:46:43 PM
All use subject to JSTOR Terms and Conditions

These two expressions have a bearing on the question of merchant profit. The etymology of sag-NÍG.GA-ra suggested above implies that sag means " that which is over and above the basic *makkūru* ", and a survey of merchant balanced accounts and related documents reveals that there is no ground to suppose that the term denotes anything else but merchant property—whether individually or corporately owned is irrelevant. The balance of these assets after expenditure is termed lá-NI, which is, in almost every case, a positive balance and is carried forward to the next account and entered as *si-ì-tum* (*šītum*) " remainder ". The essential identity of lá-NI and *šītum* is reflected in the following line from NÍG.GA = *makkūru*: nig-kas$_x$ (ŠID)-ka-lá-a = [*ši-it-ta-at*] [*ni-k*]*a-sí*, " the balance of a balanced account (is called) *šittāt nikkassi* ".[6] That this did not belong to the central accounting agency is illustrated by the fact that it could be loaned out as a private loan on interest (*YOS* 4, 37).

There is little, therefore, to suggest that the merchants of the Ur III period were agents of the state. Their precise connection with the state, as well as the benefits they derived from it, are likely to have been of many different kinds and to have varied with circumstance. That merchants appear in texts associated with state messengers or receive food rations is quite insufficient to establish that merchants were individual or corporate dependents of the state. Parallels from medieval Europe and India, as well as the obvious parallels from the present day, suggest that the relationship between merchants and the central government has always been close, but very complicated. For the merchant, the state was an important customer and, at times, a protector. For the state, the merchant was a source of goods which would otherwise be difficult to obtain and sometimes a source of liquid capital.

It is sometimes assumed that the Ur III balanced accounts were composed by the merchants to whom they refer. This, however, is a misconception, for the balanced accounts are purely archival records drawn up by a central accounting agency on the basis of tablets deposited with that agency upon the receipt of goods. These deposited tablets were normally sealed, and to this type of document belong many of the letter-orders of the Ur III period. In the unsealed archival documents, the existence of those orders or sealed receipts is reflected in the phrases dub-bi 1-àm, dub-bi 2-àm, etc., " its (i.e., the account's) tablet is one, its tablets are two, etc." When the archivist balanced the account, the sealed tablets were either destroyed or returned to their depositor. The merchant, no doubt, also kept some kind of private records, but the evidence for private book-keeping is extremely sparse for ancient and medieval times, and Mesopotamia is no exception to that rule. Private records probably had a limited lifetime before they were either destroyed or, in the case of tablets, reused. Thus, our knowledge of the merchant's side of economic activity rests upon what we can read between the lines of documents prepared by the archivists of central accounting agencies and upon the disparate evidence of private documents that have somehow survived and been discovered. A much higher proportion of private documents—but no private records corresponding to the Ur III balanced accounts—has been discovered at Nippur, but whether this is to be

[6] Recension B 32 (*MSL* 13, 115; cf. 113 i 1′ and 97:36 for variants).

This content downloaded from 131.211.208.19 on Sun, 11 Aug 2013 20:46:43 PM
All use subject to JSTOR Terms and Conditions

explained as an accident of archaeological discovery or whether one should assume that Nippur was some kind of financial and business emporium remains unclear, and I see no way of resolving the problem at present.

When one turns to the period prior to the Third Dynasty of Ur, the evidence for merchant activity in the documents becomes even more indirect. That there were merchants operating all the way back into the early third millennium is to be inferred from mention of them in archival documents (ŠAB.GAL in Uruk III and dam-gara$_x$ [GÀR] from the Fara period onward). Merchants occur in the Presargonic archive from Girsu, frequently in the capacity of traders with foreign states, but there is little to be learned about their motives from the texts in which they occur. The most suggestive evidence in this respect comes from archival texts relating to animal husbandry [7] and fishing.[8]

The basic economic principle reflected in the cattle and fish texts is the profit motive. This was observed by A. Deimel, although he did not state it in this way.[9] The temple relieved itself of the financial responsibility of maintaining hired or slave labour in these industries by the use of capital loans against a fixed rate of return. In the case of the fisheries, fishing rights seem to have been vested in the temple or state, which let them out against a specific quota of fish. In the case of cattle, the herder was also responsible for returning to the owner a fixed percentage of the herd. He himself was concerned to keep the increase as high as possible, because his profit consisted of those animals that exceeded the fixed percentage owed to the capitalist. This system seems to have been employed wherever feasible, even extending to land in the form of rents, but it is only in the records relating to fishing and cattle raising that the documents clearly reflect the debits and credits of individuals who dealt with the temple and thus allow us to infer the profit motive underlying these relationships. That this was not an exceptional practice in the third millennium is revealed by a group of documents from Umma [10] dating to the Sargonic period which also deal with cattle and which presuppose essentially the same economic structure found at Girsu. A superficial survey of Ur III cattle texts indicates that the same is true of that period also. These documents constitute the third-millennium ancestors of the herding contracts from the Old Babylonian period and provide an important piece of evidence demonstrating the continuity of economic institutions from the third millennium into the Old Babylonian period.

It is this important feature of cultural continuity to which I wish to draw attention in concluding. A. L. Oppenheim remarked [11] that Mesopotamia stands out among the societies of the Ancient Near East in its open acceptance of the economic principle of capital loans for interest. It is now apparent that this type of loan was not an invention of the Old Babylonian period but was already well-known in Presargonic Girsu.[12] This is illustrated not only by documents recording loans with interest but also by the fact that both Enmetena and Uru'inimgina were forced to undertake

political measures to rectify social inequities arising from economic processes. These pieces of evidence bear witness to a type of economic structure that corresponds more closely to a model of market economy than to a model which posits some kind of central redistributive agency such as the temple or state. Moreover, the evidence shows third millennium state executives functioning in much the same regulative activities as their Old Babylonian counterparts. This is not to suggest that market economy dominated third or second millennium Mesopotamian economic processes, but there is sufficient reason to believe that it was a significant factor in the total economic picture. Thus, the distinctions between third and second millennium economic activity cannot have been as great as sometimes supposed, and the differences which appear in the Ur III account documents, on the one hand, and in the merchant documents from Karum Kaneš, on the other, do not reflect basically different economic systems but two sides of what is basically the same system.

Julia Ustinova

THE *Thiasoi* OF THEOS HYPSISTOS IN TANAIS

In 1918 M. I. Rostovtzeff wrote that the main feature which characterized the style of life of Panticapaeum and other Greek cities of the northern Black Sea littoral in the Imperial period was the most potent, hitherto unseen, iranization of political, religious, and cultural life.[1] This idea is unanimously shared by the modern scholars, who prefer however to employ the term "sarmatization" of Bosporus.

Indeed, the religious situation in the Bosporan kingdom may be considered relatively stable up to the beginning of the first century, when it changed radically.[2] This change was due to important ethnic and political movements, which resulted in the Bosporus's dependence on Rome and the growing flow of Sarmatians, along with the natives of neighboring Black Sea regions, to the Bosporan cities.

Sarmatian migration is reflected in the archaeological record.[3] New ethnic elements appeared in the population of Korokondama, Hermonassa, Phanagoria, Kepoi, and other Bosporan cities. But the greatest influx of Sarmatians is obvious in Tanais, evidence being not only archaeological but also onomastic.[4] According to D. B. Shelov, among the names known in Tanais, 55.3 percent are the Greek ones, 4 percent the Roman, and 40.8 percent the barbarian, while among the latter, 80 percent are of Iranian origin.[5]

With the transition from the second to the third centuries, the relative quantity of the Greek and Roman names decreases and that of the Iranian ones grows.[6] On the whole, Tanais stands by itself even among the Bosporan cities of the beginning of the common era, which are distinguished by the considerable role of non-Greeks in their life. Materials of the Tanais's city site and necropolis show the permanently growing importance of the Sarmatian part of the population, and a number of peculiarities proper only to Tanais and never occurring elsewhere.[7]

As to the religious concepts of the inhabitants of Tanais, evidence of the steadiness of Sarmatian beliefs and traditions is rather rich: weapons stuck into the graves of the necropolis,[8] burial constructions in the shape of circular stone fences,[9] horse harnesses in ground graves and horse burials in barrows,[10] pieces of chalk and paint in graves—the two latter features generally related to solar and fire cults of the Iranians.[11] Fire was the sacred element of the ancient Iranians, abundant finds of portable incense-burners being indicative of the existence of the fire cult.[12]

Not a single temple or shrine of a Greek god or hero has yet been found on a comparatively well-investigated city site. Terracottas are extremely rare;[13] of all the preserved inscriptions only three mention names of Greek gods.[14] There is also no data on penetration of Oriental cults in Tanais from its founding to the beginning of the common era.

Thus, hellenization of Tanais was highly superficial. Besides, its degree diminished with the transition from the first to the second and third centuries. It is only together with the named ethnocultural process in Tanais and in the Bosporan kingdom as a whole that one is to consider the cult of Theos Hypsistos.

Inscriptions of the *thiasoi* of Theos Hypsistos are (with one exception; see below, p. 155) lists of *thiasitai* headed by their officials. All of them are dated, begin with the invocation *Agathe tyche,* and many are decorated with the images of eagles. The majority of documents have βασιλεύοντος βασιλέως τοῦ δεῖνος τοῦ δεῖνος φιλοκαίσαρος καί φιλορωμαίου as a preamble. Rostovtzeff noted that "the *tenor* of all the inscriptions allows one to suppose that the *thiasoi* were official religious associations, or in any case were recognized by the state."[15]

Four forms of designation of the associations may be found in the preserved inscriptions:

1. ἡ σύνοδος ἡ περὶ θεὸν ὕψιστον καὶ ἱερέα . . . καὶ . . . ;
2. ἡ σύνοδος ἡ περὶ ἱερέα . . . καὶ . . . ;
3. εἰσποιητοὶ ἀδελφοὶ σεβόμενοι θεὸν ὕψιστον περὶ πρεσβύτερον; and
4. θίη[σος] ἀδελφ[ῶν τῶν περὶ ἱερέα] (CIRB, no. 1284; θίησος is reconstructed, but the list of officials characteristic of the *thiasoi* of Theos Hypsistos is preserved).

An idea has been put forward that *synodoi* named in the first and the second ways and the ones named in the third way represent different types of associations because they were called differently and had different magistrates.[16] But in CIRB, no. 1284 (form 4), the word ἀδελφοί is combined with the features, which are proper to the inscriptions of the first two groups, and the "brothers" are named [συν]οδεῖται in lines 13–14. The worshiped deity being one and the same in all the associations, it seems reasonable to consider all the corporations belonging to the same institution. S. A. Zhebelev compared the Tanais inscriptions with the Athenian sacred law of *Iobachoi.*[17] In the association of *Iobachoi* members ἀπὸ πατρός and μὴ ἀπὸ πατρός did not enjoy equal rights. Since the word εἰσποιητός has the meaning "foster" (e.g., Is 3:46, 3:50, 6:36, 9:9), Zhebelev suggested considering the εἰσποιητοὶ ἀδελφοί members μὴ ἀπὸ πατρός and not the members recently admitted to the association, as a number of scholars supposed.[18]

The foster brothers were distinguished from the other members of the association; however, the latter also called themselves "brothers."[19] Μὴ ἀπὸ πατρός status was obviously lifelong as persons known as adopted brothers are also found in the *thiasitai* lists.

Εἰσποιητοὶ ἀδελφοί were headed by one or several (CIRB, nos. 1286, 1283) *presbeutai,* whose functions are unclear.

The hierarchy of magistrates in these *collegia* was rather complex. *Hiereus* is always mentioned first; in some inscriptions next goes *pater* (CIRB, nos. 1263, 1277, 1282, 1283).[20] What *pater synodou* was busy with, is not clear.

There was *synagogos* in every association. Hesychios defined *synagogos* as συνέστιος, ὁμοτράπεζος (s.v. "συναγωγός"), so one may suppose that he organized common meals. *Synagogos* could also have been the manager of finances and property of a *thiasos.*

Posts of *philagathos* and *paraphilagathos* aroused a lot of contradictory conjectures. I. V. Pomjalovski thought them to deal with common feasts, but his examples from Asia Minor are hardly convincing.[21] According to N. I. Novosadski, *philagathos* supervised the *thiasitai*'s morals and exercised control over admission of new members. The importance of these functions explains the existence of *philagathos*'s assistant.[22]

A. Salač suggested that conduct of *thiasitai* was under surveillance of *synagogos.* Pointing out the Jewish influence upon the cult of Theos Hypsistos and claiming a noncollective nature of the magistratures of *philagathos* and *paraphilagathos* in the Hellenic world, he wrote: "In the Jewish communities of Palestine and diaspora there were . . . officials called gabbâ'ê ṣ^{e}dâḳâ. The word ṣ^{e}dâḳâ means justice and charity dues. It was established that these dues were to be raised only by two officials. The nature of this post is distinctively collective, as in the

[19] Compare the Panticapaeum tombstone, erected by συνοδεῖται in honor of τὸν ἴδιον ἀδελφόν (CIRB, no. 104). The custom of calling members of collegia "brothers" was widely spread in the Imperial period (cf. A. D. Nock, "The Historical Importance of Cult Associations," *Classical Review* 38 [1924]: 105–6).

[20] Examples of the presence of *pater* in cult associations are listed in Nock's article (p. 105). A comparison with *pater* of the Mithraic mysteries inevitably comes to mind, but in this case extreme caution is necessary, for *pater* of the Mithraists held the first and not the second place in the hierarchy. The Tanais associations seem to be related to the Mithraic ones only through their common Iranian precursors. N. I. Novosadski, in terms of his conception, compared *pateres* in Tanais with *pater* of the Christian community ("Bosporskije fiasy," *Trudy Sektzii Arkheologii Rossijskoj Assotziatzii Nauchno-issledovatel'skikh Institutov Obshchestvennykh Nauk* 3 [1928]: 64).

case of *philagathos* and *paraphilagathos*."[23]

Thiasoi could have had some philanthropic purposes; in some inscriptions from Gorgippia, where the Jewish influence was appreciable, as manumissions demonstrate, even *orphanophylax* is mentioned (CIRB, nos. 1129, 1130). But *philagathos* appears in a dedication to Zeus and Hera Soteres as well (CIRB, no. 76); this post can be found in gentile associations of Asia Minor.[24] Be it not very often, one may encounter both charity[25] and supervision over the morals of the members[26] in the private cult associations on the eve of the common era.

Posts of *gymnasiarchos* and *neaniskarchos* are unanimously related to the ephebic activities. But both Greek *palestra* and *gymnasium* disappear from the life of the Bosporan kingdom just by the beginning of the common era. In graves, *palestrites*' ware is replaced with weapons.[27] No traces of *gymnasium* have been found in semi-Sarmatic Tanais. Besides, *gymnasiarchoi* are rarely listed among the members of private cult associations. J. Oehler cites only six examples, all but Tanais, and they always belong to associations of noncitizens, who were not admitted to the city *gymnasia*.[28] Arising contradiction may be obviated if one supposes that the terms *gymnasiarchos* and *neaniskarchos* were used to designate some other functions.

Below we return to the structure of the associations. For the present, two features of the Tanais *thiasoi* are to be stressed: first, not a single inscription mentions a female name; second, all or nearly all the free males of Tanais seem to have belonged to the *thiasoi*. Three hundred *thiasitai* who lived between A.D. 225 and 300, that is, in the most completely documented five years, are known by name. The total number of inhabitants of Tanais being then 1,500–2,000 (to judge by the size of the city site), the number of adult males could not exceed 250–300.[29] There is no ground to doubt that the situation was the same before or later.

[23] A. Salač, "Pri ust'je Tikhogo Dona," in *Prazska universita moskovska université: Sbornik k vyroci, 1755–1955* (Praha, 1955), p. 218.

[24] Pomjalovski, p. 27. One may note the adverb φιλαγάθως: τῷ τε Σαρ]άπει λαχῶν ἱερεύς . . . τοῖς δαπ[ανήμασιν ἀνεστράφ]η καλῶς καὶ φιλαγάθως (G. Michailov, *Inscriptiones Graecae in Bulgaria repertae,* 2d ed. [hereafter IG Bulg] [Serdicae, 1970], vol. 1, no. 13. Here it may be interpreted as pertinent to fair distribution of money, as well as characterizing piety and generosity of the honored person.

Lists of citizens that were used for examining the ethnic composition of the Tanais population are basically the lists of *thiasitai,* so the drawn conclusions may be applied to these associations.

The *synodoi* of Panticapaeum, which had the same officials as the *thiasoi* of Tanais, used to erect stelae commemorating their deceased members. A lot of stelae are decorated with the images of warriors, be they mounted or not.[30] The composition of *synodoi* is exclusively male. V. V. Shkorpil and Rostovtzeff considered them connected with the military organization of citizens.[31]

One inscription of Tanais *thiasoi* (CIRB, no. 1259) differs substantially from all the rest.[32] It is dated 11 Apelaeus 401 (Bosporan era; A.D. 104) and is dedicated to the celebration of the "Day of Tanais" by a group of ἱερεύς, συναγωγός, φιλαγαθός, παραφιλαγαθός καὶ τῶν λοιπῶν θιασειτῶν. The deity is not named. The slab (fig. 1) is decorated with a relief representing a horseman mounted on a standing horse, which is turned to the right. An altar is blazing before the cavalier, and behind the altar one can see a tree. The cavalier has long hair and a beard; he is dressed in trousers, a coat, and a cloak and holds a rhyton with his right hand. As the god is not named, T. N. Knipovitch was inclined to consider him the river god Tanais and the association *Festverein,* organized for the celebration of one festival.[33]

Shelov, following A. I. Boltunova, points out, that in this inscription the list of officials is followed with the words καὶ τῶν λοιπῶν θιασειτῶν, while normally the formula καὶ οἱ λοιποὶ θιασεῖται is used.[34] It may mean that the Day of Tanais was celebrated not by all the members of *thiasoi* but by some part of them and that the *thiasos* was founded not

[30] The outstanding *thiasitai* could be decorated with a gold crown. A gold plate with an inscription τὸ κοινὸν τῶν θιασωτῶν στεφάνουσι Ἰούλιον Καλλισθένην παραφιλαγαθὸν δὶα βίου τειμῆς χαρίν was found in Panticapaeum (V. V. Shkorpil, "Bosporskije nadpisi, naidennyje v 1907 godu," *Izvestija Imperatorskoj Arkheologicheskoj komissii* 27 [1908]: 43). On this custom in private cult associations, see E. Ziebarth, *Das griechische Vereinswesen* (Leipzig, 1896), p. 174.

exclusively for the celebration but had some other purposes, attendance at the celebration being the affair of only a part of *thiasitai*.

Salač also noted that river deities were never depicted as horsemen, and since the list of officials corresponds to that of the *thiasoi* of Theos Hypsistos, the relief is to be considered the image of this very god.[35]

Indeed, it is inconceivable that in Tanais—where all the numerous inscriptions of private cult associations belonged to the *thiasoi* of worshipers of Theos Hypsistos—an official document commemorating the Day of the city could have been issued without an emphatic calling of the god by his proper name. The absence of the god's name or *epiclesis* indicates that everybody knew him. Besides, his image was also present on the slab.

A diadem from a third century royal burial may serve as indirect evidence that Theos Hypsistos was represented as a cavalier. On the plate of this diadem the same scene as on the Tanais stela is depicted: a horseman holding a rhyton before a blazing altar, a tree behind it (fig. 2). The *thiasoi* of Theos Hypsistos were apparently patronized by the royal family, so it is quite natural to find an image of this god on a royal diadem.[36]

Finally, I. A. Levinskaja argues that there were no anthropomorphic images of Theos Hypsistos in the Greco-Roman world.[37] But the dedication to Theos Hypsistos from Lydia is carved on a stela with a relief of a sitting figure.[38] In Thracia, in a shrine of the local Theos Hypsistos, a number of dedications to that god were found together with a relief representing a bust of the god carried by an eagle.[39]

The anonymous deity was designated in the Bosporan kingdom in seven ways: (1) θεὸς ὕψιστος παντοκράτωρ εὐλογήτος, CIRB, nos. 1123, 1125, 1126 (in the Jewish manumissions from Gorgippia). (2) θεὸς ὕψιστος ἐπήκοος, CIRB, nos. 64 (inscription commemorating the erection of προσευχή by a governor of Theodosia), 1260, 1278–80, 1287, 1289 (inscriptions of Tanais *thiasoi*), 1316 (dedication commemorating a rescue). (3) θεὸς ὕψιστος, CIRB, nos. 1231 (list of *thiasitai* from Gorgippia), 1260a, 1261, 1277–86 (inscriptions of Tanais *thiasoi*). (4) θεὸς δίκαιος, CIRB, no. 1176 (Gorgippia, dedication by a vow). (5) θεὸς ἐπήκοος, CIRB, no. 1288 (Tanais, an inscription of a *thiasos*). (6) θεὸς βροντῶν ἐπήκοος, CIRB, no. 942 (inscription on a cult table from

Cytaeum). (7) θεός, CIRB, no. 71 (manumission from Panticapaeum, the former slave is liberated under the guardianship of a synagogue).

Who was this anonymous deity, worshiped under similar *epicleseis*? Modern scholars give different answers to that question. The first and the last cases are apparent,[40] but the rest have been discussed for more than a hundred years. Pomjalovski considered the god Zeus (σωτήρ, στράτιος, λαβαδεύς), since the stelae are decorated with the images of eagles.[41] V. V. Latyshev supposed it was Sabazios,[42] basing his opinion on the so-called Pirotos inscription.[43] Later he accepted the opinion of E. Schürer.[44] Rostovtzeff suggested that Theos Hypsistos Sabazios was influenced by the Iranian conception of the solar deity.[45]

In 1897 Schürer tried to ground a hypothesis, according to which the associations of worshipers of Theos Hypsistos in Tanais emerged under the Jewish influence.[46] His arguments may be summed up as follows: the expression σεβόμενοι θεὸν ὕψιστον is nearly *terminus technicus* in the literature of the Imperial period and was used to designate non-Jews who performed some Jewish rites and professed monotheistic religion; there have been Jews in the Bosporan kingdom; and among the names of *thiasitai* the Jewish ones are mentioned seven times: one name two times and another five times. He also compiled a list of applications of the *epiclesis* and demonstrated that, although it was the Judaic god who was named Theos Hypsistos most often, Zeus, Attis, Sabazios, Mithra, and other gods could be called so as well.

According to Schürer, the trend toward monotheism, which was characteristic of the Imperial period, when joined to the Judaic propaganda, led to the emergence of the syncretic cult of Theos Hypsistos. "This cult was neither Judaism nor paganism, but a neutralization of both."[47] This opinion is generally shared.[48]

N. I. Novosadski thought Theos Hypsistos to be Greek Zeus approximating the universal omnipotent deity and stressed the common features in the organization of the Bosporan *thiasoi* and the early Christian communities.[49] Knipovitch refused to advance any opinion on this problem, only supposing a possibility of relation between Theos Hypsistos and the local tradition. Her publication of the stela with relief in 1949 had an important impact on the solution of the problem. Salač connected the relief with the image of the Thracian horseman, his representations widely spread in the beginning of the common era, and claimed some traces of influence of the Dionysus-Sabazios cult.[50] A similar point of view was expressed by M. Tacheva-Hitova.[51] Recently it has been proposed that the roots of the Theos Hypsistos cult be sought in the religious concepts of the Iranians, but the authors of this suggestion did not support it with detailed arguments.[52]

At present the idea that Theos Hypsistos was Zeus has already been rejected. Thus, there are three rival tendencies in the modern literature. The adherents of the most widely spread trend consider Theos Hypsistos of the Bosporan inscriptions to be the Judaic god. The second group of scholars recognize the Thracian influence as decisive. Finally, the third direction is to search for the Iranian background in the worship of Theos Hypsistos.

After Schürer, the advocates of his conception have not supported it with new arguments of substantial importance. This conception is based upon the thesis that σεβόμενοι τὸν θεόν is *terminus technicus* meaning Judaic *semi-proselytoi* (B. Lifchitz and J. Juster) or *quasi-proselytoi* (I. A. Levinskaja). It has already been noted that, from the point of view of the law, the word *semi-proselytos* is senseless, so L. H. Feldman preferred the term "sympathizer."[53]

This word may be a conventional nomination—but nomination of what? The studies of Feldman and A. T. Kraabel demonstrated that in this case we deal with a steady scientific prejudice, wandering over handbooks, monographs, and articles as a reference to something proved long ago.[54] For decades *semi-proselytoi* were considered to be

pagans uniting in their beliefs some elements of Judaism and Greco-Roman religion, and called σεβόμενοι (φοβούμενοι) τὸν θεόν, θεοσεβεῖς, or *metuentes* in Latin. They attended synagogue, professed monotheism in the biblical sense, observed some requirements of the law, and formed a considerable social group. Hellenistic Judaism could well have succeeded in becoming a world religion if it were not for its nationalistic roots, which were, however, rejected by the Jews of diaspora without pain. A long list of scholars, whose point of view may be summed up as above, is cited in the article by Kraabel.[55]

Feldman and Kraabel doubted the firmness of this theory, verified its basis—and found out that it has been built on sand. The entire construction rests upon ten passages from Acts: 10:2, 10:22, 10:35, 13:16, 13:26, 13:43, 13:50, 16:14, 17:4, and 18:7. θεοσεβεῖς is mentioned only once: Jn 9:31. Other rare occurrences of these expressions in literature and epigraphy are interpreted, proceeding from Acts. But the careful examination of the text by K. Lake revealed that in all the cases (except two) the question is only of "pious" and "revering," without indication whether they are Jews or sympathizers.[56] An important expression, which presents an almost insuperable obstacle for the advocates of the strictly technical sense of the word, is σεβομένων προσηλύτων (Acts 13:43), which certainly cannot mean *semi-proselytoi.*

Metuentes, the supposed equivalent of σεβόμενοι in Latin, is mentioned only once: *metuentes sabbata* (Juvenal, *Satirae* 14:96–99). But this case alone was sufficient for J. Bernays to claim that Greek σεβόμενοι, φοβουμενα, and Latin *metuentes* find corresponding expressions in Hebrew, in the Old Testament, and especially in Psalms.[57] Feldman demonstrated that in Psalms this word is applied to all the worshipers of the God, and apparently to Jews in Ps 135:19–20.[58] Indeed, as Feldman puts it, "fear of God" is sine qua non for either Jews or newcomers, according to the Bible.

As to the epigraphical data, it is evident that both in Latin and Greek inscriptions these expressions were used to designate Jews (a well-known inscription from the Miletus theater)[59] as well as pagans (CIL

[59] Ἰουδαίων τῶν καὶ θεοσεβίων (A. Diessmann, *Licht vom Osten* [Tübingen, 1923], p. 391). Diessmann noted that θεοσεβίων is certainly an epitheton to Jews. Since it is impossible to claim that θεοσέβιοι are non-Jews, as they are called Jews, E. Schürer conjectures καὶ τῶν instead of τῶν καὶ (*Geschichte des jüdischen Volkes im Zeitalter*

6.390—the worshiped deity is Jupiter Optimus Maximus; Syll[3], no. 557—Apollo). One can find in Greek literature τοῖς σεβομένοις τὸν Ἄνουβιν (Plutarchus, *Moralia* 368 F), εἰπέ μοι σεβόμενος Μίθρου φῶς μέγα (Plutarchus, *Vita Alexandri* 30), and μόνον Ἄρη σεβόμενος (Pseudo-Plutarchus, *De fluviis* 14) and in Latin, Pyrrha *metuentior ulla deorum* (Ovidius, *Metamorphosae* 1.323).

One more reason may be added to these arguments. In the preserved works of Philo and Josephus, persons inclined to Judaism are never called σεβόμενοι or φοβούμενοι. Philo calls them *proselytoi* or ὁσίων ἀνθρώπων (*De Specialibus Legibus* 2.12.42), while for Josephus it was οἱ τὰ ἡμέτερα τιμῶντες ἔθη (*Antiquitates Judaicae* 3.8.9.217). It means that neither of them knew the term σεβόμενος. The same applies to the Romans. Tacitus says: "transgressi in morum eorum" (Historiae 5.5). To Roman lawyers the term was also unfamiliar: it is absent in the Roman law.[60]

Feldman concludes that "Bernay's attempt to equate *metuentes, sebomenoi, phoboumenoi* and *Yire'e Adonai* with the sympathizers and thus bring order out of chaos . . . must be therefore abandoned. . . . The resulting chaos would seem to be preferable to an order that is not in accordance with the facts."[61]

But was the Judaic proselytism really as widespread as it is usually considered to be? Recent archaeological investigations have supplied abundant information on the life of the Jewish diaspora, which demanded a reconsideration of many long-standing conceptions based on the Greco-Roman or Christian written sources. Kraabel surveyed materials of excavations of a number of synagogues with the purpose of establishing whether *sebomenoi* constituted a considerable social group and if they were connected with synagogues. He points out that neither σεβόμενοι nor φοβούμενοι are mentioned in synagogue inscriptions, about a hundred of them having been studied, and that in ten of them θεοσεβεῖς appear, but they are indisputable Jews; in these inscriptions there is nothing to suggest a Gentile "penumbria" around the diaspora synagogue communities; and symbolism used in the buildings is directed toward the Jewish community, with no apparent attempt to communicate with persons from outside.[62]

Thus, nothing reveals the presence of Gentiles having joined the Jewish diaspora communities, and there is no hint that these Jews tried to reach their Gentile neighbors with any sort of religious message. It

Jesu Christi, 4th ed. [Leipzig, 1909], 3:174, n. 9), but, as Feldman noted (p. 204, n. 20), this conjecture stays ungrounded. CIL is the *Corpus Inscriptionum Latinarum.*

means that it is necessary to reconsider the ancient tradition, Acts first of all. The historicity of some large group of *semi-proselytoi,* which has not been even mentioned in Paul's letters and which is absent from the archaeological data, is questionable in the extreme.[63] The aim of Kraabel was not to prove that Gentiles inclining to Judaism have never existed. He only demonstrated that neither written sources nor the archaeological record support the existing notion of *sebomenoi* as a considerable social group.

Two principal theses are thus of particular importance for the purposes of the present paper: σεβόμενοι θεὸν ὕψιστον is not a strict term and may describe both pagans and Jews, as well as *proselytoi;* and the missionary activity of Jews has been overestimated. The Jews of diaspora lived in the pagan environment for generations, with no attempts being undertaken to find a religious compromise with Gentiles.

We have come to the second link in the chain of arguments of Schürer: Jews lived in the Bosporan kingdom, and there were synagogues in Panticapaeum and Gorgippia.[64] The fact of the Jewish presence by itself does not mean that a lot of inhabitants of Panticapaeum itself and of Tanais were even interested in the new religion, to say nothing of proselytism.[65]

But Panticapaeum and Gorgippia were large ports, centers of cultural interaction. And it is from there that Jewish manumissions come (only Jews had to set their coreligionists free once every seven years). Then why are these manumissions absent from Tanais, where numerous inscriptions of *thiasoi* come from, if these *thiasoi* were virtually formed by Jewish *proselytoi,* as Schürer and the adherents of his theory claim? Why does not even a single hint point to the existence of a synagogue in Tanais? Why has the Jewish community left absolutely no traces? Among the Jewish *proselytoi* in the Roman Empire there were many women; women set their slaves free in Gorgippia (CIRB 1125) and Panticapaeum (CIRB 70), but why is not a single female

[63] Ibid., p. 120.

[64] In the manumission CIRB, no. 1123 the slave is set free ὑπὸ Δία, Γῆ, Ἥλιον, but it does not mean that the religion of these Jews was not orthodox (Juster [n. 48 above], p. 288; Cumont "Ὕψιστος" [n. 48 above], col. 448). A number of scholars (Lifchitz [n. 40 above], p. 159; J. B. Frey, *Corpus Inscriptionum Judaicarum,* 1:690) are convinced that the use of such clauses was a necessary formality that was not considered important by the Jews themselves. Thus, the opinion of Blavatskaja ([n. 40 above], pp. 91–96), who believed the named reason sufficient to claim θεὸς ὕψιστος παντοκράτωρ εὐλογήτος a pagan deity, is absolutely unacceptable.

[65] Inscription CIRB, no. 64 about the construction of προσευχή θεῷ ὑψίστῳ ἐπηκόῳ by Aurelius Valerius Sogos, the governor of Theodosia, is not typical, for in this very inscription it is indicated that the dedicant "has long been absent, has stayed in foreign countries for 16 years and suffered a lot of disasters." The mere originality of this fate may serve as an argument against the idea of mass enthusiasm for Judaism among rank-and-file Bosporans.

name mentioned among the Tanais *thiasitai*? Scyto-Sarmatic or Greco-Roman traditions do not explain this phenomenon: women played an important role in Sarmatian and Scythian society,[66] and a lot of women belonged to Greco-Roman private cult associations.

Schürer noted that two names of Jewish origin are mentioned in the *thiasoi*-inscriptions: Σαμβατίων (CIRB, nos. 1250, 1278, 1279, 1282, 1179) and Ἀζαρίων (CIRB, nos. 11278, 1287). He believed that they belonged to Jews living in Tanais.[67] As to Azarion, experts in Iranian languages trace its Iranian roots.[68] The name Sambation, according to L. Zgusta, penetrated the northern Black Sea littoral from the common Greco-barbarian onomasticon, which had been formed by that time.[69] It is significant that in all the cases fathers of *thiasitai* with Jewish names bear Greek and Roman names.

The last argument of Schürer and those who follow him is that the anonymous god was called Theos Hypsistos. But the list of Schürer himself, as well as the catalogs of F. Cumont, A. B. Cook, and C. Roberts, T. C. Skeat, and A. D. Nock show that many pagan gods could be named in this way.[70]

The point is that the epiclesis ὕψιστος was widespread in the Imperial period and is not evidence of direct Jewish influence.[71] It could only reflect some refined religious conception and a general tendency toward the anonymous character of the deity.

It must be emphasized that in one and the same region different deities could have been called Theos Hypsistos. For example, in Asia Minor, where the Judaic god was called thus, a dedication θεῷ ὑψίστῳ καὶ ἁγαίᾳ καταφυγῇ was found (Pisidia).[72] Ἁγαία Καταφυγή, mentioned next to Θεὸς Ὕψιστος, is surely the Roman *Sancta Tutela*. Baal in Syria[73] and Baalshamin in Palmyra[74] were also called θεὸς ὕψιστος in Greek transcriptions. A dedication of Imperial period from Lydia reads: Θεῷ ὑψίστῳ καὶ μεγάλῳ Θείῳ Ἐπιφανεῖ Δημὼ θυγάτηρ Τυράννου θεὰν

Λαρμηνὴν ἀνέστησεν.[75] Presence of the goddess excludes the possibility of Jewish influence. The same situation is characteristic of Phrygia. Examples may be multiplied. So, in the countries where under the name Theos Hypsistos the Jewish god was worshiped and where a considerable Jewish influence is doubtless, a number of other gods were also called "the most high."

One essential inference follows: in the emergence of the Hypsistos cult the decisive role was played in different regions by different gods. It is utterly impossible to accept the opinion of Levinskaja that "the cult of Theos Hypsistos, spread in Egypt, Greece, Asia Minor, Thracia, Northern Black Sea Littoral, is to be considered a single cult, having however local peculiarities. The cult of Theos Hypsistos was generally linked with Judaism."[76]

As the examples above demonstrate, a single cult has never existed. Given the general tendency of the epoch toward monotheism and the anonymous character of the deity,[77] in every particular case the image of Theos Hypsistos emerged on a definite, usually local basis, with or without Jewish influence or participation of some other gods. Consequently, extreme caution is necessary when one studies the religion of Theos Hypsistos in a given country, drawing on data from the other regions.[78]

Some scholars draw Theos Hypsistos close to Sabazios. Their argumentation is based on the so-called Pirotos inscription.[79] It is a dedication of a *koinon* θεῷ ἐπηκόῳ ὑψίστῳ. The end of the inscription is not

[75] L. Robert, "Reliefs votifs et cultes d'Anatolie," *Anatolia* 3 (1958): 117–19.

[77] Robert, "Reliefs votifs et cultes d'Anatolie," p. 118.

[78] In order to find an answer to the question why semi-barbaric Tanaits adopted Judaism, the adherents of this theory cite the example of the Khazars. But for the Khazars, first, adoption of Judaism as state religion was a political demonstration of independence and equality with the Arab caliphate and the Byzantine empire and served as a response to the attempts of both Arabian and Byzantine rulers to bend the Khazars to their will (M. I. Artamonov, *Istorija Khazar* [Moscow, 1962], p. 264), while apparently there were no reasons for the adoption of Judaism in the Bosporan kingdom. Second, the new religion was adopted only by the Khazar nobility, the majority of the population remaining Gentiles, Muslims, or Christians (D. M. Dunlop, *The History of the Jewish Khazars* [Princeton, N.J., 1954], pp. 92–115). In the Bosporan kingdom, and particularly in Tanais, the majority of the male population, if not all the male citizens, belonged to the *thiasoi* of Theos Hypsistos. And, third, the Judaism of the Khazars is reported in a great number of written sources—and the entire ancient tradition does not contain a hint to such an important event as adoption of Judaism by the Bosporan kingdom. (Phanagoria was called "a Jewish town" only in the ninth century by Ibn-Khordadbeg [see Nadel (n. 32 above), p. 24], and this epitheton is apparently connected with the Khazar presence.

[79] First published by A. von Domaszewski, "Griechische Inschriften aus Moesien und Thrakien," *Archäologisch-epigraphische Mitteilungen aus Österreich-Ungarn* 10 (1886): 238. This inscription is reported to originate from Tourres by Tacheva-Hitova (*Eastern Cults in Moesia Inferior and Dacia* [n. 39 above], p. 197).

This content downloaded from 130.238.007.040 on June 08, 2020 09:00:21 AM

preserved, and its last lines are badly damaged. The list of the members of the *koinon* ends with θια[. . .] Σεβαζιανος, which A. von Domaszewski reads as θία[σος] Σεβαζιανός. This reading is accepted by a number of scholars.[80]

Yet D. Decev supposed that Sebazianos is a proper name. His opinion is accepted by B. Gerov, Tacheva-Hitova, and Levinskaja.[81] The association is then considered a group of worshipers of Theos Hypsistos and not a *thiasos* of Sabazios.

But even if the Pirotos inscription has nothing to do with Sabazios, numerous monuments of the Theos Hypsistos cult found on the western Black Sea littoral in recent decades show the important influence of the Sabazios cult.[82] However, Dionysus-Sabazios was the most popular local deity,[83] and so his dominant role in the emergence of the Theos Hypsistos cult in the Roman epoch is quite natural.

The Thracian royal family, related to the Bosporan Dynasty, was obviously devoted to the Theos Hypsistos cult. One may cite dedications of Pythodoris and Rhoimetalkos to Theos Hypsistos[84] and a dedication ὑπὲρ βασιλέως Ῥοιμετάλκα Κότυος.[85] This devotion could have influenced the emergence of the Hypsistos religion in the Bosporan kingdom, but the evidence of the possible Thracian impact is limited to only one piece, namely, a third-century inscription on a cult table from Cytaeum (CIRB, no. 942) about the erection of a temple θεῷ βροντόντι ἐπηκόῳ by the community of Cytaeum with the sponsorship of a former royal official. An eagle clutching a snake is depicted in the lower right corner of the slab; this symbol is connected with the Sabazios cult.[86]

Dedications Διὶ βρονταίῳ ὑψίστῳ[87] and Διὶ βρονταίῳ ἐπηκόῳ[88] originate from Phrygia, and the cult of Zeus Brontaios there may also have been connected with Dionysus-Sabazios.[89]

Thus, there are three arguments in favor of the bringing together of Theos Hypsistos and Sabazios:

1. In Thracia, Sabazios played an important role in the emergence of the cult of Theos Hypsistos.

2. The Bosporan royal family was related to the Thracian dynasty, which was devoted to the cult of Theos Hypsistos; Thracians lived in the Bosporan kingdom.

3. The Cytaeum community, headed by a former courtier, dedicated an inscription to some deity having common features with Sabazios. This inscription contains neither the expression "Theos Hypsistos" nor a list of magistrates characteristic of the *thiasoi* of this god.[90]

These reasons seem sufficient to assume the possibility of some influence of the Thracian Theos Hypsistos upon the appearance of the most high god in the Bosporan kingdom, but they are inadequate to recognize this influence as decisive.

Meanwhile, the roots of the cult of Theos Hypsistos are to be searched for not in some distant land but in the Bosporan kingdom itself, in the religious concepts of the Sarmatians, or broader, of the Iranians. This approach became more promising after the publication of the stela with relief by Knipovitch.

As a parallel to the image of a horseman before a blazing altar with a tree behind it the third-century royal diadem may be cited (see fig. 2 above). A similar scene decorates a silver rhyton from the Karagodeuashkh tumulus (fourth century B.C. [fig. 3]), and Rostovtzeff proved it to be an image of the supreme god of the Iranian pantheon, a warrior and a power-giver, who had been worshiped by the Scythians and Sarmatians of old.[91] V. D. Blavatski was also inclined to draw together the Karagodeuashkh god and the image on the Tanais relief.[92]

For deeper insight into the semantics of this scene one may remember that in the Indo-European religions the tree was a symbol of the universe and an attribute of the fertility goddess, who often merged with it and whose image was sometimes substituted for the image of a tree.[93]

[90] A. Salač ([n. 23 above], p. 222) supposed that the Thracian cavalier participated in the emergence of Theos Hypsistos in the Bosporan kingdom. He considered the rhyton in the hand of the horseman on the Tanais stela to point to the links with Sabazios. But, as Rostovtzeff has convincingly demonstrated ("Predstavlenija o monharkhicheskoj vlasti v Skifii i na Bospore" [n. 14 above], p. 6), the rhyton was a sacred object of the Iranians. It appeared on the Scytho-Sarmatian monuments as well.

The problem of isofunctionality of the great goddess and the tree of the universe is treated in detail in the dissertation of I. J. Shaub.[94] Two examples, which are simultaneous with the Tanais stela, are to be cited. On a stamp from the Roman fortress of Iluraton a goddess in a bell-shaped dress with griffins by her sides is represented with her head as a top of a tree and her hands as branches.[95] A female torso is depicted on a second-century marmoreal fronton from Panticapaeum; the hands of the goddess are interpreted as branches.[96]

Thus, the picture of a horseman with rhyton before the tree, which is equivalent to the great fertility goddess, may be ranged together with such a monument as, for example, the plate of a rhyton from Merdjany (fig. 4). It represents a horseman with a rhyton before a goddess who is sitting in an armchair and holding a round vessel. On her sides there are a tree and a pole with a horsehead on it. This scene must be a representation of the sacred marriage, a stable Iranian cult image,[97] which is depicted on a carpet from the V Pazyryk tumulus,[98] on a relief from the Trekhbratni tumulus (fig. 5).[99] The relief from a late Scythian site of Chajka[100] (fig. 6) may be cited as a later example. A bearded horseman with a rhyton[101] is depicted before an altar, and near the altar stands a woman in a bell-shaped dress with some round object. D. S. Rajevski noted that the incised geometric figures—a circle above the man and a rectangle above the woman—are, respectively, symbols of the heaven and the earth fire,[102] used still by the ancient Iranians,[103] a fact that reveals once again the link between the cult of the supreme Iranian deities and the fire cult in south Russia.

A stela with a similar relief originates from the village of Kozyrka.[104] It represents a horseman and a standing figure in a long dress of the same

form, as on the Iluraton stamp and Chaika relief; beside them are two dogs attacking a boar.

The advanced suggestion on the semantics of the Tanais stela may find indirect confirmation in a slab with the image of a goddess in the fronton, used for the second time for a building inscription.[105] Shelov brings this relief together with the representation of a branch-handed goddess in the fronton of the Panticapaeum stela.[106] Terra-cottas are extremely rare in Tanais, but among them is a figurine of Kybela[107] and several pieces are specific Bosporan statuettes with suspended limbs, which are connected with the Kybela cult by a number of scholars.[108]

So, in the course of the second to third centuries the great goddess and the cavalier god advance to the foreground in the religious beliefs of the rural population of the Bosporan kingdom. The images of the sitting woman with a high headdress, grotesque figurines with suspended limbs, and images of mounted warriors dominate among the terracottas, while idol-like figurines of the goddess are the most numerous of handmade clay statuettes. Handmade figurines of horsemen were also found on some sites.[109]

The cult of the supreme cavalier god, companion of the great goddess, which existed in the south Russian steppes as early as the Scythian period, by the beginning of the common era must have advanced to the foreground, and the male deity began to dominate in the pair.

It must be noted that the spread of the images of the horse and the horseman and their supplanting of the images of other deities at the end of the first millennium B.C. and in the first centuries A.D. was going on not only on the northern Black Sea littoral but also in Central Asia and in Transcaucasia as a result of the growing popularity of the cults of the solar god, deified ancestor, and the horse brought by the Iranian nomads.[110] The same phenomenon may be observed in India after the appearance of the Saka there.[111] The worship of the solar cavalier god was obviously one of the basic religious traditions of the Iranians.

G. Widengren has emphasized the links between the Iranian ideas of the sun, Ahura-Mazda, and the horse;[112] these links corroborated both linguistic and archaeological materials.[113] The explanation lies in the Prezoroastrian beliefs of the ancient Iranians, the religious traditions of the Sarmatians and the Iranian tribes of Central Asia being very close.[114] Long before the appearance of the prophet, the Iranian cult of various "ahura" showed a tendency toward "merging into a monotheistic cult of the Supreme Ahura with the epitheton 'Mazda'—'wise.'"[115] Some scholars believe that Ahura-Mazda himself was worshiped at that time.[116] Traces of the merging of Ahura-Mazda with the sun are found in "Avesta."[117]

Nevertheless, it is too dangerous to claim that the solar god of the Massagetes is Ahura-Mazda.[118] He could have been Mithra or some other complex deity, as Mithra was also closely connected with the sun and later became a solar deity.[119] The pair deity Mithra-Ahura, equivalent to the Vedic pair Mitra-Varuna, was worshiped by the Iranians since ancient times.[120] Numerous manifestations of the fire cult were also connected with this deity.

The ancient Iranians conceived their supreme solar god as a horseman.[121] But the cult of the cavalier god was widespread in Eurasia from Germany to China,[122] and different gods and heroes were represented as horsemen.[123] Having studied the typology of the Roman cavalier

[118] Litvinski, p. 40.

[119] Gershevitch, pp. 31–42.

[120] Litvinski (n. 111 above), p. 41. J. Scheftolowitz ("Die Mithra-Religion der Indo-Skythen und ihre Beziehung zum Saura und Mithra-Kult," *Acta orientalia* 11 [1933]: 295–97) has put forward the following hypothesis: having adopted Zoroastrianism in the Achaemenid epoch, the Saka began to worship Ahura-Mazda as the supreme deity, but in the image of Mithra, who had been known to them long before. It resulted in an amalgamation of the images of the two gods.

[121] Representation and cult of the horseman cannot be interpreted on the basis of the most ancient Indo-Iranian mythology. Both "Rig-veda" and "Avesta" usually mention carriages (Kuz'mina [n. 11 above], p. 107). The appearance of horsemen is connected with the spread of cavalry tactics in battle in Eurasia by the beginning of the first millennium B.C. Only then could the anthropomorphic images of cavalier gods and heroes appear in the ideology.

reliefs, E. Will inferred that the deities appear as cavaliers not because they are such by their nature or because their worshipers are always mounted but because they perform an action that demands a horse: fighting evil or hunting, that is, chasing evil forces. The cavalier god struggles against world evil; he is defender and savior, the supreme guardian of justice.[124] But the functions of the Iranian supreme solar god were exactly the same.

Thus, the monotheistic tendency has evidently been present in the development of the Sarmatian religious concepts, and it is the Iranian tradition that explains the monotheistic trend in the cult of Theos Hypsistos. The image of the Most High God may have been related to the idea of the pair deity Mithra-Ahura, some hints to duality being traced in the Bosporan deity.[125] This supreme solar god, defender and fighter against evil, was represented as a horseman in the Iranian world. Bosporus was no exception.

The Greco-Roman element must have played some role in the emergence of Theos Hypsistos, but "hellenization" of the deity has not been deep. Indeed, the formal organization in Greek *thiasoi* seems to have covered traditional Iranian associations.[126]

What was the name of the god whose image has developed into that of Theos Hypsistos? A story told by Iamblichos may be conducive to the solving of the problem (Ἰαμβλίγου Δραματικόν 9, second century). He narrates in detail about Pharnouchos, Pharsiris, and Tanais, who gave name to the river Tanais, and tells that the mysteries of Aphrodite in this country and in the area of Tanais are the mysteries of Tanais and Pharsiris. The root "pharn" is evident in the name "Pharnouchsos," and "Pharsiris" means "with shining face."[127] Pharsiris must have been the solar deity, and Pharnouchos was related to "pharn," one of the basic concepts in the Iranian ideology, comprehending grace, power, happiness, and good luck.[128] Aphrodite was the local incarnation of the great goddess. So the Iranian divine triad appears,[129] which was sometimes conceived as a pair consisting of a male and a female deity.

[124] Will, p. 124. We are thus forced to infer that it is impossible to connect automatically the genesis of one cavalier god with another, i.e., the Bosporan horseman with his Thracian and Danubian counterparts. The concepts of cavalier gods may have emerged independently or in parallel under the influence of the same concepts—in our case, the Iranian concept of divine horseman.

Iamblichos calls the local festival in honor of Tanais, Aphrodite, and Pharsiris "mysteries." One may suppose that the pair Pharsiris-Aphrodite is equivalent to Theos Hypsistos–great goddess, whose worship is documented with a great number of monuments from Tanais and other sites on the northern Black Sea littoral.

The role of Tanais, who was worshiped by the Sarmatians, according to Iamblichos and other ancient writers (Pseudo-Plutarchus, *De fluviis* 14; Maximus Tyrius, *Oratio* 8.8), is rather curious. Salač thought the Day of Tanais to be an anniversary of the reconstruction of the town after the Polemon's crushing,[130] but this idea seems less probable than a suggestion that the Day of Tanais was the day of the god Tanais, since in ancient times the day of any town could be celebrated only as a day dedicated to the divine patron of this town. Participation of a special "committee" of *thiasitai* in the organization of such a festival may be explained by the fact that some relations may have existed between Tanais and the precursor of Theos Hypsistos, if it was Pharsiris.

As Theos Hypsistos was primarily the Iranian solar god and there were so many Sarmatians among his worshipers, one may envisage the structure of *thiasoi* in quite a different way. As already noted above, the exclusively male composition of the Tanais *thiasoi* and a number of magistratures distinguishes them from the "normal" Greek or Roman private cult associations.

Rostovtzeff regarded the Bosporan *thiasoi* as military organizations and sacral and political citizen associations.[131]

Meanwhile, a hypothesis that the Iranian tradition of *Männerbünde* underlies the structure of the Bosporan *synodoi* explains all these peculiarities.[132] S. Wikander demonstrated that the written sources, and "Avesta" first of all, contain evidence of these ancient Iranian societies.[133] He has paid special attention to the connection of men's societies to the cult of Mithra.[134] According to Wikander, men's societies were ecstatic cults, the drinking of Haoma being one of their major rituals (cf. the rhyton held by the god on the Tanais stela and the evidence on mysteries celebrated in the town); the cult of the deceased was an important

sphere of their activity (cf. erection of tombstones by the Bosporan *synodoi*); the cult in the men's societies was linked to the fire cult (the role of the fire cult in Tanais has already been emphasized); men's societies guarded the general maintenance of justice and punishment of infringers and were extremely meticulous in moral issues (cf. the offices of *philagathos* and *paraphilagathos*); a classical feature of the men's societies were initiations that allowed the men to become members of the ideal community of deceased and living warriors.[135]

Unquestionable vestiges of men's societies were preserved up to recent days by the modern peoples of Soviet Central Asia.[136] According to K. V. Trever, age classes, which were closely related to the men's societies, existed in Achaemenid Persia.[137] The Parthian warrior societies are studied in detail by Widengren.[138]

So, both literary sources and modern ethnographic data prove the existence of Iranian *Männerbünde*. But there is evidence directly concerning the ancient Iranian nomads. Herodotus (4.26) tells about the custom of Massagetes to eat their old men, which certainly reflects the existence of age classes.[139] The Hippocratic corpus contains an indication that "there are a lot of eunuchs, who are occupied with women's work and speak women's language" (*De aeris* 29). The languages that were kept secret from the opposite sex and the strict division of occupations into those proper for men and women is indicative of the existence of *Männerbünde*.

Activity of the men's societies covered exactly those spheres that are supposed by the titles of *thiasoi* officials: military and athletic training (*gymnasiarchos*), supervising of boys and teenagers (*neaniskarchos*), strict control over the members' morals (*philagathos* and *paraphilagathos*), common cult (*hiereus*), and general guidance (*presbuteros, pater*). As these titles are Greek equivalents of corresponding Iranian notions, they could not have been absolutely accurate.

Incorporation of an ancient Iranian institution into the social structure of the Bosporan kingdom demanded its reorganization and hellenization.[140] Indeed, the amazing terminological uniformity is certainly

a result of a well-considered action directed by the government, maybe by Sauromates I;[141] otherwise the terminological diversity characteristic of the private cult associations of the Greco-Roman world would be inevitable. The use of the Greek terms and some organizational principles made the Iranian institution acceptable to the Greeks.

The nearly universal belonging of Tanais men to *thiasoi* is also explained: *Männerbünde* had to embrace all the men who enjoyed full rights.

Thus, by the beginning of the common era the cult associations appeared to be the most effective form of military training and ideological organization of citizens in the Bosporan kingdom. Preservation of these societies, however modified, in the Bosporan kingdom is not surprising: this form of social organization demonstrated its astonishing steadiness, having outlasted the epoch of its appearance by millennia. One may remember the conservation of numerous features of *Männerbünde* in the everyday life of the Central Asian Tadjiks and Uzbeks in the second half of the twentieth century, to say nothing of the evident system of age classes in Achaemenid Persia. Some scholars cite the Mithraic associations of the Imperial period as another example of modification of the Iranian men's societies.[142]

There is nearly nothing definite to be said about the performance of the Theos Hypsistos cult in Tanais. But the only complex that is to be interpreted as pertinent to the cults may be related to the cult of Theos Hypsistos. In a cellar of an exedra-type chamber of a second–third century house in the northeastern corner of the site, among the other objects, a limestone altar, seven clay stamps, five portable incense burners, six lamps, and a small hearth were found,[143] the altar, stamps, and incense burners having been in the cellar at the moment of the destruction of the building. As a parallel, one may cite two Chersonesos cult cellars, where altars and lamps have also been found.[144]

Since, first, images of eagles decorate a number of stelae of the Tanais *thiasitai,* and eagles clutching snakes are on the Panticapaeum clay stamps[145] and on the cult table from Cytaeum, and second, Theos Hypsistos and Theos Bronton Epekoos are identical in his opinion, Shelov suggested that stamps were also used in the cult of Theos Hypsistos and that this cult convened in the cellar.[146] The only obstacle to

this theory was the presence of chthonic features in this cult (they are supposed by the use of the underground sanctuary), but Shelov connected them with the chthonic features in the Zeus Bronton cult.

It has been mentioned above that the identification of the Cytaeum god and Theos Hypsistos does not seem doubtless. Clay stamps were widely used throughout the ancient world and in the Bosporan kingdom in particular, for example, in the great goddess cult. Thus, Tanais stamps may have belonged to the cult of this goddess. As to the use of this cellar and maybe some others, cellars could well be used in the Theos Hypsistos cult. As already noted, chthonic features are evident in the cult of Iranian *Männerbünde*. Then, Mithra was worshiped in a cave in Persia (Firmicus' Maternus, De errore profanarum religionum 5), as well as in the Roman mystery religion, and Mithreum itself was conceived as a cave by Mithraists.[147] The presence of caves in the cult of the Iranian solar god appears to be an ancient Iranian element and not a Roman innovation. There are no caves in the neighborhood of Tanais, and it would have been quite natural if the inhabitants of the town exchanged cellars for caves. The Mithraists acted so as well, constructing some special dark chambers if there were no natural caves at hand.

Another cellar in the southwestern part of the site is also very curious. The cellar was used in the second century, earlier than the building itself. It was filled up with fragments of raw brick and pottery, and in this debris a terracotta figurine of an eagle was discovered.[148] Similar terracotta was found in a second–third century cellar in Olbia.

[147] F. Cumont, *Textes et monuments relatifs aux mystères de Mithra,* 2 vols. (Brussels, 1896–99); M. J. Vermaseren, *Corpus inscriptionum et monumentorum religionis Mithraicae,* 2 vols. (The Hague, 1956–60).

[148] Compare the eagle carrying the image of Theos Hypsistos from the Serdica shrine (see above, p. 156). Most interesting is the ritual burial of eighteen rams in the filling of this cellar (Shelov, p. 289). One more burial of a ram in a pit of a Tanais cellar also seems to be ritual (T. M. Arsen'jeva, "Raboty v Tanaise," in *Arkheologicheskije otkrytija* [Moscow, 1972], pp. 110–12). Similar ritual ram burials have been known in Neapolis Scythica (T. N. Vysotskaja, "Kul'ty i obrjady pozdnikh skifov," *Vestnik Drevnej Istorii* 3 [1976]: 60) and on the Kozyrka site (A. V. Burakov, "Gorodishche bilja s. Kozyrki poblizu Ol'vii," in *Arkheologichni pam"jatki URSR* [Kiev, 1962], 11:73–74). Both in Kozyrka and in Tanais lamps were found in these burials. Indeed, lamps must have played some role in the Tanais cults. In Neapolis bones of five rams were found together with fragments of cult vessels and statuettes in the building "E," which is related to cult purposes (Vysotskaja). It is worth noting that it was in Kozyrka that the relief of a horseman before a standing woman was found (above, p. 167). The ram played an important role in Iranian beliefs. Rams are predominant on zoomorphic handles of Sarmatian vessels (Litvinski [n. 111 above], pp. 6–7, 92). Litvinski traced the relations between the concept of "pharn," which was extremely important for the Iranians, and the image of the ram, considered an incarnation of the pharn, in the culture of the Central Asian peoples, the Ossetians and, finally, the Sarmatians (pp. 59–74). Thus, ritual burials of rams appear to be linked with Iranian beliefs, although it is impossible to claim their direct relation to the cult of Theos Hypsistos.

R. I. Vetstein related it to the Jupiter-worship of Roman legionnaires.[149] Two statuettes of the same type, made of Panticapaeum clay, were found on the territory of the Bosporan kingdom.

It is highly tempting to connect the Tanais figurine with the images of eagles on the *thiasitai* stelae. Well known is the role of the eagle as a companion of the supreme Indo-European deity, his symbol and often his personification.[150] However, the eagle was an attribute of the majority of solar and supreme deities,[151] and one cannot claim the Tanais terracotta to be pertinent to the cult of Theos Hypsistos without any doubt.

The conception set forth in the present article is certainly far from being grounded exhaustively. New archaeological finds or new approaches to the existing data may change the situation substantially. But the present state of the problem forces one to admit the decisive role of the Iranian background in the emergence of the cult of Theos Hypsistos in the Bosporan kingdom, its ideology and organization being, of course, hellenized and transformed under the influence of both general cultural and religious tendencies of the Imperial period and the specific Bosporan conditions.

Mesopotamian Elements and the Watchers Traditions

Ida Fröhlich

Introduction

By the time of the exile, early Watchers traditions were written in Aramaic, the vernacular in Mesopotamia. Besides many writings associated with Enoch, several works composed in Aramaic came to light from the Qumran library. They manifest several specific common characteristics concerning their literary genres and content. These are worthy of further examination.[1] Several Qumran Aramaic works are well acquainted with historical, literary, and other traditions of the Eastern diaspora, and they contain Mesopotamian and Persian elements.[2] Early Enoch writings reflect a solid awareness of certain Mesopotamian traditions.[3] Revelations on the secrets of the cosmos given to Enoch during his heavenly voyage reflect the influence of Mesopotamian

1. Characteristics of Aramean literary texts were examined by B.Z. Wacholder, "The Ancient Judeo-Aramaic Literature 500–164 BCE: A Classification of Pre-Qumranic Texts," in *Archaeology and History in the Dead Sea Scrolls*, JSOTSup8, ed. L.H. Schiffman (Sheffield: Sheffield Academic Press, 1990), 257–81.

2. The most outstanding example is 4Q242, the Prayer of Nabonidus that suggests knowledge of historical legends on the last Neo-Babylonian king Nabunaid (555–539 BCE). On the historical background of the legend see R. Meyer, *Das Gebet des Nabonid*, SSAW.PH 107, no. 3 (Berlin: Akademie, 1962). 4Q550 uses Persian names and the story reflects the influence of the pattern of the Ahiqar novel; see I. Fröhlich, "Stories from the Persian King's Court. 4Q550 (4QprESTHAR^{a-f})," *Acta Ant. Hung*. 38 (1998): 103–14.

3. H. L. Jansen, *Die Henochgestalt: eine vergleichende religionsgeschichtliche Untersuchung*, Skrifter utgitt av det Norske videnskaps-akademi i Oslo. II. Hist.-filos. klasse no. 1 (Oslo: I kommisjon hos J. Dybwad, 1939) examined the figure of Enoch in the light of the Mesopotamian tradition years before the finding of the Qumran manuscripts. On the figures of the Watchers in the background of Mesopotamian tradition, see Amar Annus, "On the Origin of Watchers: A Comparative Study of the Antediluvian Wisdom in Mesopotamian and Jewish Traditions," *JSP 19* (2010): 277–320.

cosmological lore.[4] The figure of Enoch, and the elements of the revelation tradition associated with him, originates in the figures of the Mesopotamian *apkallū-s* (wise ones), more exactly in the figure of the Mesopotamian diviner-king Enmeduranki, and in the tradition about divine revelation given to him.[5] Thus it can be assumed that the kernel of the Enochic tradition, the *Book of the Watchers* (*1 Enoch* 1–36), was shaped either in a Babylonian Jewish diaspora community or perhaps in a community of returnees that maintained traditions from the Babylonian exile. This group of writings might have been expanded by later additions to the text.[6]

The narrative of the Watchers (*1 En.* 6–11) belongs to the earliest textual layer of *1 Enoch* and represents one of the earliest traditions of the collection. In chapters 6–11 two distinct narratives exist: the narrative on Shemihazah and that on Asael.[7] The bulk of this early tradition is contained in the Shemihazah story (*1 En.* 6:1–7:62). According to the Shemihazah story, a group of the sons of heaven (6:2), whom the text refers to as the Watchers (*ʿîrîn* as in Dan. 4:10), glimpses the daughters of men, desires them, and decides to descend to them. Their leader Shemihazah (*šmyḥzh*) considers the plan to be sinful, and he does not want to bear the responsibility alone (6:3). Therefore, the Watchers, in order to fulfill their plan, swear to unite on Mount Hermon (*1 En.* 6:6). Then the Watchers ". . . began [to go in to them, and to defile themselves with them and (they began) to teach them] sorcery and spellbinding

Grelot, "La Géographie mythique d'Hénoch et ses sources," *RB* 65 (1958): 33–69; Grelot, "La Légende d'Hénoch dans les Apocryphes et dans la Bible," *RSR* 46 (1958): 5–26, 181–210; Grelot, "L'Eschatologie des Esséniens et le livre d'Hénoch," *RevQ* 1 (1958–59): 113–31; Grelot, "Hénoch et ses écritures," *RB* 82 (1975): 481–500, written before the publication of the Aramaic fragments.

5. James C. VanderKam, *Enoch and the Growth of an Apocalyptic Tradition*, CBQMS 16 (Washington DC: Catholic Biblical Association of America, 1984), 116. On the Mesopotamian background of the Enoch figure and of the Son of Man figure, see H.S. Kvanvig, *Roots of Apocalyptic: The Mesopotamian Background of the Enoch Figure and of the Son of Man*, WMANT 61 (Neukirchen: Neukirchener Verlag, 1988). See also S. Bhayro, "Noah's Library: Sources for 1 Enoch 6–11," *JSP* 15 (2006): 163–77. It is again the group of the Mesopotamian *apkallu-s* (sometimes viewed negatively and counted as demonic and evil beings in Mesopotamian tradition itself) that A. Annus understands to be the origins of the Watchers. See Annus, "On the Origins of Watchers," 282.

6. A similar case is the Danielic collection, the earliest pieces of which demonstrate a good knowledge of Mesopotamian lore.

7. Early scholars dealing with this work have already noted this fact. R.H. Charles, *The Book of Enoch* (Oxford: Clarendon, 1893), 13–14, differentiated between two narratives in the text of *1 En.* 6–11. More recently Paul D. Hanson, "Rebellion in Heaven, Azazel and Euhemeristic Heroes in 1 Enoch 6–11," *JBL* 96 (1977): 197–233 and G.W.E. Nickelsburg, "Apocalyptic and Myth in 1 Enoch 6–11," *JBL* 96 (1977): 383–405 have analysed the constituents of the text and they too differentiated between two sources.

[and the cutting of roots; and to show them plants" (7:1). The women became pregnant from them and bore children, who became Giants. The Giants "were devouring [the labour of all the children of men and men were unable to supply] them." (7:4). After this, the Giants begin to devour men, and then ". . . they began to sin against all birds and beasts of the earth] and reptiles . . . and the fish of the sea, and to devour the flesh of one another; and they were] drinking blood. [Then the earth made the accusation against the wicked concerning everything] which was done upon it" (7:5-6).[8] These then are the transgressions, which finally bring about the punishment of the flood (*1 En.* 9:1ff). Thus the story serves as a justification for the catastrophic punishment wreaked upon humanity.

The Asael story (*1 En.* 8:1-2) is not a retelling of the story of the Watchers; it is rather a commentary on certain elements of the narrative. It mentions Asael who taught metalworking, making weapons and jewels for men, and the knowledge of eyeshadows, of precious gems and dyes of mineral origins for women.[9] The section on Asael's teaching is followed by a report on the teachings of Shemihazah and his companions; they taught the interpretations of heavenly *omina*, each Watcher teaching the signs of the natural phenomenon that was included in his name (*1 En.* 8:3-4).

The whole section ends with a report of the punishment of Asael and the Watchers. Asael was punished by the angel Raphael for the sin Asael perpetrated; he was bound and cast into darkness, where the Watchers will stay until "the great day of judgment" (*1 En.* 10:4-7). On the other hand, the punishment mentioned in the Shemihazah story is the binding of Shemihazah and his companions by Michael "for seventy generations" after they were forced to witness their children, the Giants, perish (*1 En.* 10:11-12). The devastation of the flood following these events signifies the purification of the earth (*1 En.* 10:1-3, 20-22).[10] The narratives on Shemihazah, Asael, and the flood revolve around the problem of the origin of evil. The Shemihazah narrative is similar to Gen. 6:1-4, which is also connected with the flood. The relation of the two stories is complicated. The story of Shemihazah and his companions is a

8. Translated by J.T. Milik, based on the Aramaic text reconstructed by him; see Milik, *The Books of Enoch: Aramaic Fragments of Qumran Cave 4* (London: Clarendon, 1976), 166–67.

9. *1 En.* 65:6 supplements the list of the teachings of Asael by adding that the Watchers also taught people to cast metal and to make cast metal statues. According to *1 En.* 69, a Watcher named Penemue taught people writing and the use of ink and papyrus, practices that later could be the source of several misunderstandings. For further discussion of these traditions associated with the angel Penemue, see the essay by Leslie Baynes in this collection.

10. Nickelsburg, "Apocalyptic and Myth."

logical and continuous narrative, whereas Gen. 6:1–4 seems to be a series of theological reflections on the story narrated in *1 Enoch*.[11] As to the background and meaning of the story of the Watchers, earlier theories saw historical and mythological motifs behind the narrative. The motif of the integration of heavenly and earthly beings would have referred to and negatively judged the mixed marriages of the priests in the postexilic era, objected to by Ezra. The motif of the bloodshed would have mirrored the wars of the Diadochi.[12] Other theories look for mythological models, seeing the motif of the teachings of the Watchers as modeled after the myth of Prometheus, Asael being a *protos heuretes*. Of course, neither historical-sociological nor mythological models, including Greek images, can be ruled out. However, observation of only one or two motifs of the narrative does not illuminate the background and meaning of the whole story. Many elements of the story, such as cannibalism and consuming blood, the basically negative nature of the teachings of the Watchers, magic and interpretation of *omina*, are left unexplained. In order to ascertain the background and the exact meaning and message of the narrative, all major elements of the narrative must be considered. This can be followed by a discussion of the issue of foreign literary influences. The traditions associated with the Watchers were relevant themes in Qumran literature. They were often cited and referred to in other works, certainly because the meanings were considered relevant for the spiritual world of the community.[13] The Watchers supposedly held significance for them, and motifs associated with them embodied basic ideas of the Essene tradition.[14] Notions that are related to each of the motifs of the story are those of *sin and impurity* and *magic and the demonic*.

11. Scholars generally consider the Shemihazah story as an expansion and explication of Gen. 6:1–4. There is no room here to discuss the relation of the two texts; this will be the aim of a further study.

12. D. Suter, "Fallen Angel, Fallen Priest: The Problem of Family Purity in 1 Enoch 6–16," *HUCA* 50 (1979): 115–35; R. Rubinkiewicz, "The Book of Noah and Ezra's Reform," *FO* 25 (1988): 151–55; Nickelsburg, "Apocalyptic and Myth in 1 Enoch 6–11," 383–405.

13. The *Nachleben* and infuence of the Watchers' story in the literature of Qumran requires a separate study. See the essay by Samuel Thomas in this collection.

14. According to P. Sacchi, the peculiar conception of evil based on *1 En.* 6–11 was a distinct ideological tradition that was the catalyst of the schism between the group and Judaism in the fourth century BCE. Michael Stone and David Suter date the schism to the third century. See G. Boccaccini, *Beyond the Essene Hypothesis: The Parting of Ways Between Qumran and Enochic Judaism* (Grand Rapids: Eerdmans, 1998), 76–77.

Sin and Impurity, and the Story of the Watchers

The purity system of ancient Israel is acquainted not only with physical impurities, but also ethical ones.[15] Ethical impurity grows out of situations that are controllable and are not natural or necessary, such as delaying purification from physical impurity, polluting specific *sancta*, sexual transgressions, idolatry, and murder. The locus of uncleanness may be the person, but proscriptions refer more to the pollution of the sanctuary or land.[16] Punishments of these sins are more severe than the consequences of physical impurities. Punishment of the sinner is usually the banishing/driving away (*kārēt*) from the land or the extinguishing of one's family.[17] The main list of ethical impurities is in the Holiness Code (Lev. 17–26). Sins are related to four categories: sexuality, violence, death, and magic.

1. Sins related to sexual relations are cases of the *zenūt,* usually translated as fornication, which includes all kinds of illicit sex: sex among blood relatives, with another's wife, homosexual relations, sex with a menstruating woman, and prostitution (see Lev. 18:1-30; 19:29). A special case in the list is *kilayim*, the prohibition of mixing together different kinds of animals, plants and materials in human clothing (Lev. 19:19, Deut. 22:9-11). A special case of *zenūt* not listed in Lev. 17–26 is remarriage with one's divorced wife with her, in the meantime, having been remarried and then divorced or widowed (Deut. 24:1-4; cf. Jer. 3:1).

2. Sins related to blood: bloodshed (Deut. 21:1-9; cf. Gen. 4:10, Ps. 106:38-39)

3. Sins related to the dead: a corpse left on the tree for the night (Deut. 21:22-23; cf. 11QT 64:11-12).

4. Sins related to magic: "Do not resort to ghosts and spirits or make yourselves unclean by seeking them out. I am the LORD your God" (Lev. 19:31). Magical practice is sometimes conceived as *zenūt* (Lev. 20:6), and those who practice it are to be killed (Exod. 22:17).

15. On the distinction between types of purity based on nonbiblical anthropological evidence, see L.N. Rosen, "Contagion and Cataclysm: A Theoretical Approach to the Study of Ritual Pollution Beliefs," *African Studies* 32 (1973): 229–46.

16. W.D. Davies, *The Territorial Dimension of Judaism* (Minneapolis: Fortress Press, 1991); D.P. Wright, "Unclean and Clean, Old Testament," *ABD* 6:729–41, esp. 738–39.

17. For example, the Assyrian exile of Israel is explained in 2 Kgs. 17:5–23 as a punishment resulting from "the sin of Jeroboam," the improper cultic practice of the northern kingdom.

Results of ethical impurities are summarized in Lev. 18:27-30: "The people who were there before you did those abominable things and the land became unclean. So do not let the land spew you out for making it unclean as it spewed them out. Observe my charge, therefore."[18] Qumran texts enrich the biblical theory of impurities.[19]

The sins of the Watchers are their transgression of the cosmic order and mixing with earthly women, and their teaching of magic. They became impure by this process (*1 En.* 7:1; cf. 4Q531 1, 1). The *Book of Giants* qualifies their relation as a case of *zenūt* (4Q203 8, 9), one of the main categories of ethical impurities. On an analogical basis the mixing of heavenly and earthly beings can also be a violation of the *kilayim*, prohibition of the mixing of categories. The practice of magic is again an ethical impurity according to the biblical system.

The sins of the Giants, sons of the Watchers are violence, bloodshed (cannibalism), sins against the animals, birds, and fishes, and drinking of blood (*1 En.* 7:4-5). Homicide is among the sins that make the land impure (Deut. 21:9). Cannibalism is not known from the biblical system. The meaning of the sins committed against the animals is not clear; it can be a violation of the prohibitions concerning food. This presupposition is confirmed by the report on their consuming of blood, which is a violation of the biblical prohibition (Gen. 9:3-4). These are the sins of the Watchers and their offspring that made the earth impure. The resultant flood is not only a punishment of these sins but also, at the same time, a purification of the earth.

The Giants in the Enochic Tradition

1 En. 15:8 refers to the offspring of the Giants as demons (Ethiopic *nafsat*, Aramaic רוחא).[20] These beings are spiritual in nature, following their fathers' nature; they do not eat, they are not thirsty, and they know no obstacles. Their

18. The citation is a summary of the Holiness Code in Lev. 17–26. The land is the Land of Canaan into which the people were about to enter.

19. The Temple Scroll (11QT) considers as impure the non-observance of the dietary laws (11QT 48:6–7), the bodily signs of mourning (tattooing) (11QT 48:10), covenant and marriage with the "inhabitants of the land," which constituted idolatry (11QT 2:1–15, cf. Exod. 34:10–16), burial grounds not separated from surroundings (11QT 48:11–17), the non-separation of sufferers from bodily impurities (flux, leprosy, plague, scab, menstruating women, women after childbirth), and idolatry repeatedly mentioned as *zenūt* defiling the land. 4QMMT (4Q394–399) adds to the list of impurities the offering taken from the pagan corn, and highlights cases of forbidden marriages (priests' marriage with commoners' daughters) as cases of *kilayim*.

destructiveness first and foremost affects children and women, as they were born of women.[21] The Giants are also the protagonists of the *Book of Giants*. The Aramaic fragments belonging to these manuscripts from Qumran are not contained in the Greek and Ethiopic translations. According to the narrative of a Qumran fragment, one of the Giants took to the air "as whirlwinds, and he flew with his hands/wings as [an] eagle."[22] According to this, Giants were shaped like human figures that could fly like the wind.

Although the story of the Watchers in the *Book of the Giants* does not mention any demons,[23] the motifs of the story are related to the realm of the demonic. The characteristics of the Giants evoke the Mesopotamian tradition about the *utukku-s*, a term generally used for demonic beings. The Enochic Giants have the same characteristics as the Mesopotamian demons; they are tall and obtrusive beings, roaming in bands, attacking their victims indiscriminately. They ravage the work of humans,[24] devour the flesh of animals and humans, and consume their blood. They are born from a sexual union of heavenly and earthly beings, considered in the Enochic story to be impure.

The punishment for the sins of the Watchers is binding them and casting them into darkness. Asael is bound by the angel Raphael and Shemihazah is bound by Michael. Demonological texts regularly mention that the demon is binding his victim. The witch, a constant figure of the Mesopotamian incantation series, *Maqlû*, binds her victim by her practices. The binding effect of the witchcraft is mentioned in the title of a series of incantations entitled "The pregnant woman who was bound."[25] The bonds made by witches can be solved by another kind of magic—healing incantations.

"Binding" is a constant motif in the Mesopotamian creation myth *Enūma elīš,* in which the triumph of the gods over their demonic enemies is marked by binding the enemies. Triumphant Ea binds Apsu, the primeval ocean, and

20. For a discussion of the Watchers traditions and later demonology, see the essays by Kevin Sullivan and Silviu Bunta in this collection.

21. This part of the tradition is known only from the Greek and the Ethiopic translations. 4Q204, the fragment that supposedly contains this part of the text, is not legible at this place. It is to be supposed that this part was also contained in the Aramaic text tradition of the Enochic collection.

22. 4Q530 7ii4, see L.T. Stuckenbruck, *The Book of Giants from Qumran: Texts, Translation, and Commentary* (Tübingen: Mohr Siebeck, 1997), 128–34.

23. See, though, *1 En.* 19:1, and the essay by Randall Chesnutt in this volume.

24. 4Q531 2+3, 1–10 speaks in more concrete terms than the Shemihazah story, and mentions that the Giants were devastating fruit, wheat, trees, sheep, and cattle.

25. V. Haas, *Magie und Mythen in Babylonien: von Dämonen, Hexen und Beschwörungspriestern*, Merlins Bibliothek der geheimen Wissenschaften und magische Künste 8, (Gifkendorf: Merlin, 1986), 170.

builds his house over his breast. He also binds Apsu's helper, Mummu. Marduk binds Tiamat; after splitting Tiamat in two, he forms the netherworld from the monster's inner parts.[26]

Magical Arts

In the Shemihazah story, the Watchers teach humans magical practices: "sorcery (*ḥršh*) and spellbinding (*ksph*) [and the cutting of roots (Gr. *ridzotomia*); and to show them plants . . ." (*1 En.* 7:1). The first two nouns are general terms for magical practices. The "cutting of roots" means, in all probability, the making of herbal ingredients for magic and making amulets containing herbs and roots.[27]

Asael and his companions teach men metallurgy, the making of weapons and jewels. To the women they teach the art of makeup and cosmetics, the most precious and choice stones, and all kinds of coloured dyes (*1 En.* 8:1). Metallurgy and smithing are very closely related to the notion of magic. Ironsmiths were considered sorcerers in the belief system of the ancient and modern Near East.[28] Weapons made by forgers were attributed to magical power. Jewels served originally as amulets with apotropaic function.[29]

The ancient magical origin of makeup, especially the painting of eyes and lips, is well known, and similarly the magic of jewels.[30] In *Enūma elīš*, the Mesopotamian creation myth, all the gods at war wear amulets, using their magic power against their enemies. According to the myth of *Inanna's (Ištar) Descent into the Netherworld,* the fertility goddess going to the netherworld must

26. Ibid., 92.

27. The Talmud is acquainted with two sorts of *kemi'ot* (amulets): a written one (a parchment with quotations from various sources, including the Scriptures), and the *kame'a šel iqrin*, an amulet made from roots of a certain plant (*Shab.* 61b).

28. On the general idea see M. Eliade, *Forgerons et alchimistes*, Homo Sapiens (Paris: Flammarion, 1956). In Ethiopic, ironsmith and magician are denoted by the same word (*duban-ansa*); see W. Leslau, *Concise Dictionary of Geʿez (Classical Ethiopic)* (Wiesbaden: Harrasowitz, 1989), 181; similarly the descendants of Cain, who are ironsmiths in the Bible (Gen. 4:16-24), in the later tradition related to them are associated with magical motifs (Syriac "Cave of Treasures," folia 12a, col. 2; for an edition, see C. Bezold, *Die Schatzhöhle* [Leipzig: Hinrichs, 1883; reprint Amsterdam: APA-Philo Press, 1981]). In the Ethiopian tradition the belief that ironsmiths have magic capabilities and knowledge is alive to this day; they are considered sorcerers and therefore members of other groups do not marry their daughters to them. In an incantation of the series *Maqlû* (II.128) the witch (*kaššaptu*) is called "silversmith," whose spells could be undone or removed by the incantation. See G. Meier, *Die assyrische Beschwörungssammlung Maqlû neu bearbeitet* (Osnabrück: Biblio-Verlag, 1967)

29. Haas, *Magie*, 197–98.

30. Ibid.

part with one of her seven magical powers, represented by an item of her garments and jewels, at each gate of the netherworld. At the end of her journey she arrives naked and powerless before Ereškigal, the lady of the netherworld. In the Sumerian variant of the myth, two pieces of Ishtar's cosmetics and jewels are specified as having the power of sexual attraction: her eye-mascara is called "Let a man come, let him come," and her pectoral is called "come, man, come."[31]

The holistic worldview of the Mesopotamians considered everything an omen for future events, and the interpretation of *omina* was generally practiced. Such traditions were collected and systematized in a series of interpretations. A collection of interpretations on heavenly phenomena and meteorological *omina* can be found in the series *Enūma Anu Enlil* (When Anu and Enlil) from the Neo-Babylonian era.[32] Its content is similar to the teachings of Shemiḥazah and his companions that are referred to in the Enochic story.

The Story of the Watchers as a Myth of the Origin of Evil

The story of the Watchers is a myth that speaks to the origin of evil in the world.[33] According to the narrative of the Enochic collection this is the first event following creation (the material of Gen. 2–5 [with the exception of the reference to the patriarch] is not included in the Enochic collection). The first stage of the birth of evil is dysfunction in the cosmic order, a result of the mixing of heavenly and earthly beings, a deed considered as a sin related to sexual relations (*zenut*), and a case of ethical impurity (sin resulting in the impurity of the committer and the land). Sins of heavenly beings (bloodshed, consuming blood) are again considered sins that make impure the sinner and the land he or she lives in; therefore evil in the world originates from sins resulting in impurity (ethical impurities). Initiators of the sins are the heavenly beings who descend to the earthly women, driven by their desire. The Watchers are conscious of the nature of their deeds. They even agree together to commit the sin collectively. The narrative does not mention human responsibility. The authors and agents of the deeds are the Watchers. The Giants, the beings born from the cosmic dysfunction, initiate further anomalies

in the world. These anomalies are ethical sins resulting in the defilement of the earth. Impurity of the earth results in the punishment of the flood.

The story of the Watchers is an independent story that is parallel to the narrative of Gen. 6:1-4 about the angels and the daughters of men, and not an interpretation of Gen. 6:1-4.[34] The story of the Watchers contains a message that cannot be found in Gen. 6:1-4. It is a determinist myth and an alternative tradition to the message of the primeval history of Genesis. In the Enochic tradition evil originates from the deeds of the Watchers, after creation. According to Genesis, the origin of evil is due to human disobedience (Gen. 2–3). The tradition of the Watchers is often referred to in Qumran texts, with the implication that this is the origin of evil. On the other hand, the biblical story of Gen. 2–3 is almost never mentioned at Qumran.

The author(s) of the Enochic story in the *Book of the Watchers* consciously use Mesopotamian lore to theorize about the origins of evil. The bearers of evil and impurity are demonic beings, the offspring of the Watchers. For the author and audience, demons are working in world history. The story of the Watchers (*1 En.* 6–11) was written following the Babylonian exile. The *terminus ad quem* is the end of the third century BCE. Its language is Aramean, the vernacular of Mesopotamia and the *lingua franca* of the exiled Judaeans from the sixth century BCE.

The attitude of the Enochic collection toward the Mesopotamian world and tradition is manifold. The figure of Enoch and the revelations given to him reflect a working knowledge of the Mesopotamian traditions about the *apkallū*, the antediluvian sages, a priestly tradition from the city of Eridu.[35] In

34. There is no room here to go into the problems of the relation of the two texts. Although Wellhausenian text criticism assigned Gen. 6:1-4 to the Yahwistic source, there is no evidence for an early provenence of this short and disjointed text that may even be a series of reflections of a Priestly redactor (fourth century c. BCE). The Enochic story of the Watchers is backgrounded by a tradition not dependent upon Gen. 6:1-4, which was formed prior to the end of the third century date of the manuscripts of the *Book of the Watchers* as they are known to us. The Enochic story is thought by some scholars to be an interpretation of Gen. 6:1-4. See D. Dimant, "1 Enoch 6–11: A Fragment of a Parabiblical Work," *JJS* (2002): 223–37. Similarly S. Bhayro, "Daniel's 'Watchers' in Enochic Exegesis of Genesis 6:1-4," in *Jewish Ways of Reading the Bible*, JSSSup 11, ed. G.J. Brooke (Oxford: Oxford University Press, 2000), 58–66, and Archie T. Wright, *The Origin of Evil Spirits: The Reception of Genesis 6.1-4 in Early Jewish Literature* WUNT 2.198 (Tübingen: Mohr Siebeck, 2005). For a different view see Philip R. Davies, "And Enoch Was Not, For Genesis Took Him," in *Biblical Traditions in Transmission: Essays in Honour of Michael A. Knibb*, JSOTSup 111, ed. Charlotte Hempel and Judith M. Lieu (Leiden: Brill, 2006), 97–107. See, too, the essay by Chris Seeman in this volume.

35. See James C. VanderKam, *Enoch: A Man For All Generations*, Studies on Personalities of the Old Testament (Columbia, SC: University of South Carolina Press, 1995).

fact, several elements of the story of the Watchers are shaped by the effect of a gentile Mesopotamian background of the work. Genealogical impurity (the Giants born from the relations of the Watchers and the earthly women) is the first level of the systematic spread of the evil in the world. Elements related to impurity, sin, and intermarriage were those necessary for the self-determination of a group, the keeping of shabbat and special purity rules being the qualities that distinguished the exiles from their native gentile neighbours. The meaning of the Watchers' story is that impurities and sins lead to the defilement of the earth and a catastrophic punishment.

Traditions related to magic and connected with the origin of the evil in the story are a reaction against magic, widely practiced in Mesopotamia. The Mesopotamian elements in the Watchers' story are not simply borrowed; they are recontextualized and appropriated in many ways. Mesopotamian *utukku-s*, the evil spirits, may have served as models to the figures of the Giants. Mesopotamian lists of interpretations of *omina* were referred to in the names of the Watchers who were told to transmit forbidden knowledge.[36] Elements related to magic in the *Book of the Watchers* may be backgrounded by Mesopotamian magical practices that were well known among people living in the Babylonian diaspora.

The fragments of the *Book of Giants* found in Qumran represent a literary tradition related to the core of the Enochic collection, the account of the Watchers contained in *1 En.* 6–11.[37] Due to the fragmentary nature of the text, its plot cannot be reconstructed fully and only some details can be recognized. Events of the antediluvian period are referred to several times. Such are the deeds of the Watchers, their defilements, the begetting of "Giants and monsters," as well as to the devastation and bloodshed of the Giants (4Q531 frag. 1,2 and lines 4-6, 8); and the "great corruption in the [earth]" that they caused (4Q532 frag. 2, 9). The Giants, sons of the heavenly Watchers, are victims of the devastation; they must perish in the Flood, together with humans.[38] Their doom is presaged in several dream-visions related in the *Book*

36. On the scribal series and related literature, see Annus, "On the Origins of Watchers," 287–292.

37. This tradition is not contained in the Greek or in the Ethiopic tradition of *1 Enoch*. Among Qumran texts it is represented by 4Q203, 4Q530, 4Q531, 4Q532, 4Q533. The fragments were edited first by J.T. Milik, *The Books of Enoch. Aramaic Fragments of Qumran Cave 4* (London: Clarendon, 1976). A further publication of the text (adding to the list 1Q23, 1Q24, 2Q26, 4Q206 2-3, 4Q556, 6Q8, and not including 4Q533), with a commentary is Stuckenbruck, *The Book of Giants from Qumran*. The definitive publication, with further additions and joins is from É. Puech, *Qumrân Grotte 4. XXII: Textes araméens. Première partie, 4Q529-549*, DJD 31 (Oxford: Clarendon, 2001), 17–116.

38. The Watchers do not perish in the Flood; their punishment is binding; cf. *1 En.* 10:4-7, 11-12.

of Giants. The interpreter of their dreams is Gilgamesh who probably is an independent figure in the text, and not one of the Giants.[39] His name appears in the company of Giants whose names (Ohyah, Hahyah, and Mahawai) are of unknown origin, and with Watchers, part of those names are unknown from other lists.

The *Book of Giants* makes frequent references to dreams, and sections of dream-visions are found in it. The dreams are oracles on the future destruction of the Giants. Gilgamesh is mentioned twice in the fragments. The first mention is a message of Gilgamesh on the doom of the Giants, in Ohya's words (4Q530 frag. 2ii+6+7i+8+9+10+11+12[?], 1-2). The second time Gilgamesh is the interpreter of a dream, the interpretation being transmitted to the giant Ohya. It cannot be established from the fragments if Gilgamesh belongs to the Giants or not—only his function as a dream-interpreter is certain. It is to be noted that the same fragments mention also Enoch, "the noted scribe" as an interpreter of dreams who is told to be able to "interpret for us" (i.e. for the Giants) a dream (4Q530 frag. 2ii+6+7i+8+9+10+11+12[?], 14). Enoch is an authority in revelation: Mahawai is sent to him in order to learn their fate (4Q530 frag. 2ii+6+7i+8+9+10+11+12[?], 21).

Previous research associated the figure of Gilgamesh in the Enochic collection with the epic hero.[40] However, no episode known from the epic can be connected with the Gilgamesh of the *Book of Giants*. On the other hand, in Mesopotamian texts beyond the Gilgamesh epic, Gilgamesh is clearly pictured as a netherworld ruler.[41] Described sometimes as "Nergal's little brother" he was a figure with special relation to Nergal, ruler of the netherworld.[42] He appears in the company of chtonic deities as one who sits in judgment in the netherworld.[43] His name is very rarely found in Old Babylonian documents,

39. Gilgamesh is mentioned twice, in 4Q530 frag. 2ii+6+7i+8+9+10+11+12[?], 2) and 4Q531 frag. 22:12; 4Q203 frag. 3:3.

41. It is worth noting that Gilgamesh is never mentioned in the epic as one who becomes a netherworld god.

42. See A.R. George, *The Babylonian Gilgamesh Epic*, vol. 1 (Oxford: Oxford University Press), 107.

apart from the several copies of the epics.[44] In turn, religious texts from the late libraries mention him frequently as the sovereign of the underworld who, after his life on earth, became king of the underworld—a Babylonian Osiris, identified with Nergal.[45] Gilgamesh as judge and ruler of the shades in the netherworld had a specific role in ancestor cult and magical healing (incantations).[46] Netherworld connections and mantic functions are regularly interrelated in religious beliefs. Gilgamesh as king of the netherworld interprets *omina* pertaining to kings. "The omen of Gilgameš the mighty king (*amūt gilgameš šarru dannu*), who had no rival" and variations are frequent in the omen tradition of the late period.

Thus, Gilgamesh, as a ruler of the shades in the netherworld, had three primary functions. As a judge, he judged the case of the sufferer (the prayers use legal terminology to speak of the sufferer). As an omen-interpreter he was able to foretell future events and to prognosticate the sufferer's fortune if he dies or remains alive. Finally, as one who had authority over troublesome ghosts he was believed to be an effective healer. The three roles were interrelated, and each of them was related to the healing of a sickness (believed to be caused by harmful magic).[47]

The Gilgamesh motif in the *Book of Giants* reflects a good awareness of the Mesopotamian scholarly tradition of the interpretation of *omina*, taught in the higher-level schools (it is here to be noted that first-millennium scholarship focused more on magic and divination).[48] Several Qumran Aramaic texts witness that Jewish authors were well acquainted not only with literary texts but also with astronomy, calendar, and the tradition of the interpretation of *omina*. The figure of Gilgamesh in the *Book of Giants* reflects knowledge where Mesopotamian elements are used and transmitted with the same meaning as they were applied in the Mesopotamian culture. This figure matched perfectly with the demonic images of the Watchers and the Giants, shaped with the help of characteristic elements from Mesopotamian culture.

The Fifteenth-Century Ruthenian Translations from Hebrew and the Heresy of the Judaizers: Is There a Connection?

Moshe Taube

To dramatize things a little, let me start with the declaration that not only do I strongly believe that the Ruthenian translations from Hebrew made in Kiev by Jews in the second half of the fifteenth century are linked to the Novgorod-Moscow heretics, but I also believe that the Muscovite Principality in the second half of the fifteenth century may well have been on the brink of succumbing to a Jewish conspiracy to proselytize Muscovy from the top, a plan orchestrated by learned Jews from the Polish-Lithuanian Commonwealth with mystic inclinations, with the perhaps unsuspecting collaboration of highly placed officials in the court of Ivan III, and with the sovereign himself hesitant for a while and playing his cards both ways.

The Judaizers

The series of events that led to the uncovering and eventually to the eradication of the heresy of the Judaizers in Novgorod and later in Moscow can be resumed as follows (a lucid account can be found in, e.g., Fennell 1962:324ff.):

According to church sources, namely Archbishop Gennadii of Novgorod and Iosif Sanin, abbot of Volokolamsk, the two main persecutors of the heretics, the movement started in Novgorod in 1470, shortly before the annexation of Novgorod the Great by Muscovy. In that year prince Mikhailo Olel'kovich of Kiev visited Novgorod on the invitation of the pro-Lithuanian party, in company of several nobles and merchants, among them the learned Jew Zacharia or Skhariia, knowledgeable in matters of astrology, astronomy, necromancy, and magic. This Zacharia succeeded in derailing several priests of the lower white clergy, some of whom were later invited (surprisingly enough, by Ivan III himself)[1] to come to

[1] Ivan III himself apparently was sympathetic, for some time at least, to the heretical circle. Thus Zimin (1982:218) says: Но особую опасность для ревнителей православия представляло то обстоятельство, что покровительствовал московским вольнодумцам сам государь всея Руси, а наследником престола был сын Елены Стефановны – Дмитрий). The indications

Moscow, where two of them were appointed to churches in the Kremlin. There they went on with their efforts to expand the movement, obtaining protection from Fedor Kuritsyn, chief diplomat of Ivan III (heading the *posol'skii prikaz*), as well as from the Moldavian princess Elena, wife of Ivan Ivanovich the Younger. Elena (nicknamed Moldovanka or Voloshanka), Ivan III's daughter-in-law, daughter of Stefan the Great of Moldavia [1457–1504] and of Evdokiia, the daughter of Prince Olel'ko Vladimirovich of Kiev, was the mother of Dmitrii, the young prince who in 1498, after his father's death in 1490, was crowned with Monomakh's cap and pronounced in the presence of his grandfather Ivan III as the designated heir to the throne of Russia. Thus his mother Elena also happens to be the direct cousin of the aforementioned Mikhailo Olel'kovich of Kiev, as well as a cousin of the sovereign.

So this looks like a family affair, only it so happens that the family involved is the first family of Muscovy, which is certainly no accident, since the conspirators must have been aware of the example of the Christianization of Rus' by St. Vladimir, suggesting that in Russia there was no room for grass-roots revolutions, and that religious changes had to come from the top. They may also have been aware of the fact that not long before the conversion of Vladimir to Christianity, the conversion of the Khazar ruler to Judaism resulted in the Judaization of his kingdom.

In 1487 Gennadii discovered the heresy in Novgorod and began persecuting the heretics, though without strong backing from either the secular power, namely Ivan III who had appointed him archbishop, or from the ecclesiastical authorities in Moscow, certainly not from Metropolitan Zosima, appointed in 1490, who was himself accused of secretly endorsing the heretics. In this period many pamphlets and polemic letters were written by Gennadii, especially regarding the eagerly awaited end of the world in the year 7000 from the Creation, which according to the Orthodox calendar corresponds to 1492 AD. When the end did not occur, the heretics mocked their opponents by showing their calculations to have been wrong, whereas the calendar used by the heretics, based on Jewish calculations, was right. After several delays the heretics were finally brought to trial and punished severely. In 1502 Elena and her son Dmitrii were imprisoned, and by 1504 the heresy had been definitively crushed.

This chain of events relating to the years 1487–1504, repeated in practically all the history books, does not entail agreement on the interpretation of the nature of

of this patronage are: 1. It was Ivan himself who invited the two heretical Novgorod priests, Aleksei and Denis, to Moscow, and had them appointed there to the Kremlin churches; 2. His protégé Fedor Kuritsyn, head of the Moscow heretics, was never brought to trial; 3. The unusually formulated oath of Ivan given in 1488 to his brother Andrei: Князь же великии клятся ему землеи и небом и богом силным, творцом всея твари. Even Luria had to admit (1960:143) that this is an all but heretical formula (клятвой странной, не находящей соответствия в других памятниках и едва ли не еретической), especially if we compare it to the usual verbal formulations accompanying the kissing of the cross: one renounces, in case of perjury, 'God's Grace, that of His most holy Mother, and that of the great miracle workers': нє будєт ми милости божиєи и пречистои его матери и великих чюдотворцевъ.). For possible motives for this support see Döpmann 1967: 77–80.

the heresy, of its ideology, and especially regarding its affinity to Judaism, but, on the contrary, an ongoing controversy surrounding these questions. The present author by and large accepts the overall interpretation of the heresy given by Thomas M. Seebohm in his masterly 1977 book *Ratio und Charisma*, a book ignored for obvious reasons by Soviet historiography, but for less obvious reasons by Western scholarship also.[2] His interpretation is based on an extensive study of all the published texts relevant to the heresy, and may be summed up as follows:

The heresy is an original Russian phenomenon, or a phenomenon *sui generis*, for which only very partial analogies, and certainly no affiliatory influence, can be traced in the West. It started in Novgorod as a reformatory movement within the White Clergy, whose aim was to reform the Church from within. After its transfer to Moscow, however, it became a *Bildungsbewegung* borne mainly by the newly emerging class of the *d'iachestvo* (*дьячество*), the educated lay functionaries serving in the administration of the Muscovite state, whose interests were less toward religious questions than to worldly-scientific literature. Their interest in religious problems is, rather, of a political nature. However, the underlying ontological concepts of the translated literature, echoed in the original literature of the heretics, reflect a strict prophetic Monotheism incompatible with central concepts of Christian dogma, such as Trinity, Incarnation and Resurrection. The sovereignty assigned to reason, its being posited as the foundation for any religion, and the legitimacy claimed for the search of truth at every available source, including the pagan Hellene Aristotle, who is compared in this literature to a prophet, were justifiably seen by the Church as a threat to its monopoly on fixing a binding canon of literature. Since the translated texts were of Jewish origin (and, we may add, even the Moslem ones were disguised as Jewish) and displayed a pronounced **mono**theistic conception (a conception, we may add, even more accentuated by

[2] I know of only one review of the book, written by M. Cazacu in the *Revue des Études Slaves* (1979), which briefly describes but does not really discuss its contents and conclusions. In a few papers, which I was able to trace after a prolonged effort following my own very belated discovery of the book in 1999, the book is simply referred to in a footnote as a bibliographical item, without details. 1) Frank Kämpfer 1995, reviewing Cesare de Michelis 1993b, when criticizing the author for ignoring the German language literature on the subject; 2) M.V. Dmitriev, in a 1997 paper on the scholarly legacy of A. I. Klibanov; 3) N. P. Franz, in a 1996 paper on Kliment Smoliatich. 4) F. von Lilienfeld, whose 1963 book on Nil Sorskii had been critically reviewed by Seebohm (1965), mentions Seebohm's 1977 book in her 1978 paper as 'forthcoming', but *does* not refer to it in any of her subsequent writings. The only author who does discuss and quote Seebohm's book was the German philosopher Wilhelm Goerdt (1984:159, 161, 330–334). Nevertheless the book remained unknown to most Slavists, and is not discussed or even mentioned where it should have been, e.g. in general reviews of translated literature in Rus', e.g. I. Ševčenko 1981, F. J. Thomson 1999, or in studies devoted to specific texts discussed by Seebohm in his book, e.g. studies, on the *Laodicean Epistle* by Ja. S. Lur'e 1982, Rainer Stichel 1991, Cesare de Michelis 1993a and b, Moshe Taube 1995b and 1998. The most recent work mentioning Seebohm that came to my attention after this paper was complete is the essay by Joel Raba in *Russia Mediaevalis* X, 1 (2000), 126–149: «Жидовствующие» ли? История задушевной мысли.

editorial modifications in the Slavic) which can easily and with good cause be interpreted as antitrinitarian, the Russian Church had every reason to suspect the heretics in "Judaizing". The Church lacked the conceptual and institutional tools to carry on a serious, matter-of-fact discussion with the heretics in order to eliminate or assimilate their ideas. It chose therefore the juridical way, accusing them of being "Judaizing apostates," in order to eradicate the heretics and with them the heresy. This was done in two phases. At the 1490 Council the Novgorodian reformatory clerics were decimated. It was only in 1503, after Ivan III was forced to make a shift in his church policy, that the Muscovite *d'iaks* were in their turn tried, although some of the "mighty," in first place their leader Fedor Kuritsyn, escaped persecution.

Why then has this reasonable account not found its way into mainstream Russian historiography? The reason is that in recent decades the thorniest questions of the cultural history of medieval Russia had been dominated by the late Iakov Solomonovich Luria, the most prominent authority on the subject of the Novgorod-Moscow heresy. Starting with his first publication on the subject in 1955 (AFED, with N. Kazakova) and until his last paper in 1996, Luria grew more and more skeptical about the Jewish nature of the heresy (see my criticism of his position in Taube 1995a, 1995b, 1997, and 1998).

One of the consequences of Luria's dominance of the field was the discouragement of scholars from investigating the "Literature of the Judaizers," the corpus of literature translated at precisely that time from the Hebrew into Ruthenian in the Grand Duchy of Lithuania.

The Literature of the Judaizers

Translations from Hebrew in the East Slavic area began about 1400.[3] The translations present two chronological groups:

I. The first group belongs to the first half of the fifteenth century, where we encounter Hebrew works, mainly historical accounts, integrated into Russian compilations such as the *Explanatory Paleia* and the East Slavic Chronicles called "Chronographs." These translations include:

1. The "Life of Moses" integrated into the *Explanatory Paleia* (see Taube 1993), including interpolations from midrashic sources on Joseph's coffin, the golden calf, and more.

2. Excerpts from the *Josippon* in the *Academy Chronograph* (see Taube 1992) on Antioch IV Epiphanes and the Hasmonean revolt, on Zorovavel and King Darius, and on Alexander the Great in Jerusalem.

3. We also have a complete reworking of the last part of the *Josippon*, dealing with the destruction of the temple, entitled *Plenenie Ierusalima tretee Titovo*

[3] For the controversy on this point see Lunt and Taube 1988, Alekseev 1993.

(Плененіе Иерусалима третее Титово), integrated into the second redaction of the Hellenic and Roman Chronicler (text published by Tvorogov 1999, see also Taube 1989).

This first group, belonging to the very beginning of the fifteenth and possibly even to the end of the fourteenth century consists of texts that show traces of Ruthenian, as well as Novgorodian dialectal features which the translations presumably acquired as they underwent editorial treatment when integrated into Russian compilations. In all probability the *Book of Esther*, a Jewish translation, but one made from (Judeo-)Greek, not from Hebrew (see Altbauer and Taube 1984, Lunt and Taube 1994, 1998), belongs too to the first group, for it shares with it some linguistic traits, especially in the lexicon. The circumstances that gave rise to the translations of this first group, which precedes the emergence of the heresy, are still not clear. There is evidence, however, that some known Muscovite Judaizers showed interest in them, e.g., the scribe, annotator and editor Ivan (Ivashko) Chernyi, who extensively glossed a 1489 copy of the *Hellenic and Roman Chronicler* (AFED: 277–278).

II. The second group is traditionally called the "Literature of the Judaizers," following Sobolevskii's 1903 appellation, and it belongs to the second half of the fifteenth century. It includes:

1. Al-Ghazālī's *Intentions of the Philosophers*, namely the two first sections: Logic (published by Neverov 1909) and Theology (excerpts published in Sobolevskii 1903: 407–408);

2. Moses Maimonides' *Logical Vocabulary* (excerpts published in Sobolevskii 1903:402–403). Items 1 and 2 combined constitute in Slavic the *Logika*;

3. Johannes de Sacrobosco's *Book of the Sphere* (Sobolevskii's "Cosmography," 1903:409–413, see Taube 1995a);

4. Emmanuel Bar Yaakov Bonfils' *Six Wings* (Sobolevskii 1903: 413–419, Taube 1995a);

5. Pseudo-Aristotle's *Secret of Secrets* (Sobolevskii 1903: 419–423, edited by Speranskii 1908), in Slavic including the following interpolations:
   Maimonides' *Treatise on Sexual Intercourse*,
   Maimonides' *On Poisons and their Antidotes* (excerpt),
   Maimonides' *Book of Asthma* (chapter 13),
   Rhazes' chapter on "Physiognomy" from the second part of his book *Al-Manṣuri*;

6. The *Laodicean Epistle*, and specifically its first part, the *sorites*, or cyclical maxim on the soul in eight lines (AFED: 256–276) – a most influential text circulating in Muscovy and related to Fedor Kuritsyn (see Taube 1995b, Taube 1998 [1994]);

7. The collection of nine Old Testament Hagiographa in the single sixteenth-century Vilnius Codex (f.19 RKF 262 of the Academy Library, see Altbauer 1992), which is clearly a copy of an earlier manuscript. The precise dating of the collection, however, is unclear.

This second group[4] consists of Ruthenian translations, most of which underwent some degree of russification when copied and glossed in Muscovy.

Who were the translators?

There can be no doubt that the translators were Ruthenian Jews. There are numerous indications in the philosophical and astronomical texts that demonstrate knowledge of Jewish tradition, of Jewish interpretation of Scripture, etc. We will, however, content ourselves here with one direct example from Chapter 13 of Maimonides' "Logical Vocabulary":

The Hebrew, like the Arabic original, has:

(LM13.6.4) And a name said **of a particular and of a universal**, is when a species is referred to by (the name of) the genus, e.g., 'Kokhab' is the name of any star in the heaven, as well as of a particular Planet (i.e. Mercury), or the name Hashish in Arabic referring to any plant as well as to the yellow flower used for painting.

The Slavic, however, has a different example:

(LM13.6.4) а има рєчєноє во всє^{м} и єдинє то ижє нарєчєсѧ сѣщєство всѧчєство^{м}. ꙗко рєчє^{м} Ізраиль **всѣмъ намъ** има. и одномѣ мєжи нами.

(LM13.6.4) And a name said **of a particular and of a universal**, is when a species is referred to by (the name of) the genus, e.g., **'Israel'** is the name of **us** all, as well as of an individual among **us**.

This choice of example, which refers to 'Israel' in the first person plural, leaves no doubt about who was dictating the text.

How were the translations carried out?

The texts were translated by learned Ruthenian Jews with an adequate knowledge of Medieval Jewish philosophy, but with a less than adequate knowledge of the literal, massively calquing Hebrew language of the translations from Arabic. Since they presumedly did not know Arabic (although there is no indication of their being Ashkenazi), their only recourse in case of difficulty was to commentaries to the works translated, or to other works dealing with similar subjects. Traces of these channels of recourse can be found in the Slavic. The circumstances of the actual work of translation as I imagine it are as follows: the Jewish translator has in front of him a Hebrew version, or several Hebrew versions of the text to be translated, and he dictates it to his Slavic collaborator, who puts it down in writing, occasionally "correcting" it according to the scribal conventions he is accustomed to. The

[4] A separate place should be assigned to the "Psalter of Fedor," a collection of Jewish prayers for various occasions, camouflaged as an orthodox Psalter with 20 Kathismas and 8 odes, translated from memory (See Zuckerman 1987) by a converted Jew sometime between 1464 and 1473. There seems to be no connection between this translation and the heresy. The Psalms which Gennadii was given by the repentant heretic Naum (AFED 316) and which he finds "distorted" (AFED 319) will have to be sought elsewhere.

Jews dictated their literal translation into a vernacular, heavily polonized Ruthenian, presumably the only variety of Slavic they were familiar with. The dictating was done by the learned Jew, versed in Hebrew medieval philosophy, but not in the Slavic literary or scientific tradition, to a Christian proficient in the writing traditions of Ruthenian, perhaps belonging to the circle of people interested in this literature. Unmistakable marks of such a method of translation are doublets, not just of single words but of **clauses**, reflecting self-correction by the translator noted down by the scribe in both wordings. This second variety of doublets is found only in the logical section of Al-Ghazālī's *Intentions*, which did not undergo any further edition and consequently any linguistic or textual corruption or correction. These are markedly different from doublets consisting of single words, which usually result from glosses that found their way from the margin into the text. In the text below, these doublets of phrases are marked by square brackets around the repeated phrase.

A probative illustration for this method of translation comes from the explanation of the difference between common name and proper name, with the example being '*eḇed ha'el* – the Hebrew equivalent of Arabic *Abdullah*, both as a proper name and as designing 'God's servant'.

(LA1.2.4) וכאשר אמרת עבד האל והיה שם כנוי, היה נפרד, לפי שאתה לא תכוין בו אלא מה שתכוין באמרך דיד.

(LA1.2.4) а коли рє$^{\bar{ѵ}}$ємъ богорабъ, а было бы то прозвищо, было бы особ^{ѣ}ное. ҙанже ты нє мыслишь тымъ. алѣ ш^{і}то мыслишь ꙗко рє$^{\bar{ѵ}}$ешь, [ҙовомо самостїю, ино бѫдє$^{\bar{т}}$ ҙа єжє ты нє мыслишь, ни$^{\bar{ж}}$ли ꙗко бы єси рє$^{\bar{к}}$лъ], исаи дв^{і}дъ.

(LA1.2.4) And when we say 'God's servant' as a surname (that is *Abdullah*), then it would be (considered) simple, since you do not intend by it but what you intend by saying [properly speaking, it would be: since you do not intend but what you would have, by saying] 'Jesse,' 'David.'

This example is particularly revealing, since the Slavic scribe wrote down not only the reformulation of the clause, but even the words 'properly speaking,' clearly a sign that the scribe was unable to distinguish between the dictated text and the translator's aside, or metatext.

What can we learn from the translated texts about the ideology of the translators?

We can of course make deductions from the choice of texts considered worthy of translating, as well as from details in the translations themselves, especially from passages that do not derive from the Hebrew version. We notice first that the corpus is made up, beside the books of Scripture, of texts that can be characterized as scientific or scholarly, but which are completely devoid of any specific theological doctrine favoring any known religion. They display the tendency, common to medieval rationalists of all religions, to mobilize the tools of rationalism, in particular logic, and especially syllogisms, for proving in terms common to all the existence of a cre-

ator. We also notice the absence of any catechistic or moralizing elements, apart from the praise of basic moral values common to all humans. These can best be seen in the conclusion of one of the central texts of our corpus, the *Logika*.

The centrality of the *Logika* stems from the fact that, from among the texts specifically mentioned by Gennadii as writings being in the possession of the heretics, it is one of two treatises (the other being the *Six Wings*) that can be identified with a Slavic text translated from Hebrew bearing that same name.

In the Slavic version of Chapter 14 of Maimonides' *Logic* we find the following text, the main part of which, *marked in the translation by italics*, is unattested in either Arabic or Hebrew:

14.2.1 А мѫдрость сїю исполнилъ Аристотєль голова всѣмъ философомъ первымъ и послѣднимъ, подлѫгъ смыслу мудрєцовъ Израилевыхъ, ажє по плѣнєнїи нє нашли своихъ книгъ, а спѫстилисѧ на єго разѫмъ иже ровєнъ во пророчєскїихъ фундамєнтєхъ. 14.2.2 занєжє нєвозможно єсть абы пророкъ нєполонъ былъ в сєдми мѫдростєхъ. а овсѣмъ в логицѣ ‹и въ› пѫт{ны}хъ. А исполнилъ єѧ осмыми книгами прєжєрєчєнными. иже она направитъ каждого в тыхъ мѫдростєхъ. 14.2.3 а она подобна єсть вазѣ и мѣрє и ослѣ златои.

14.2.1 And this Wisdom was perfected by Aristotle, *chief of all Philosophers, both ancient and recent in accord with the view of the wise men of Israel, as after the exile they did not find their books, so they relied on his wisdom, which is equal in its foundations to that of the prophets.* 14.2.2 *For it is inconceivable that a prophet be unaccomplished in the seven wisdoms, and in particular in Logic <and in> the Mathematical sciences. And he completed it in the aforementioned eight books. For it guides everyone in those wisdoms,* 14.2.3 *and it is like a weight and a measure and like a Touchstone for Gold.*

The Slavic then resumes with several verses from Chapter 14 on the division of the sciences. But, starting with the seventh science, that of Theology, the Slavic text once more departs from the Hebrew (the departure is marked by italics):

14.5.1 сєдмаѧ мѫдрость бжєтвєнная. она єсть глава всѣмъ сєдмимъ. и ѧдро иˣ статоүноє. 14.5.2 занєжє єю оживѣтъ во вѣки дїа үлїүєскаѧ. 14.5.3 а то познаєт кождое вѣры үлїкъ. иже жадныи глѫпыи ѳ бїа нє можєт быти. 14.5.4 а то подобно какъ бы нѣкто рєклъ иже ѣазъ кнѧзю слѫжѳ а кнѧзѧ нє вѣдаю. или хожу в цр҃ковь. а гдѣ цр҃ковь нє вѣдаю. 14.5.5 а сїа сєдмь мѫдростєи нє подлѫгъ жаднаго законѳ. нєжєли подлѫгъ үлїүєства. 14.5.6 а можєѧ каждыє вѣры үлїкъ кохати в ниˣ. какїже видимъ иже во всѣхъ вѣрахъ сѣть прото иже законникъ подобєнъ скарбникѳ. а мѫдрєцъ томѳ, үто дабываєт. 14.5.7 а на каторѫю рѣчь нє прикладаю т подлѫгъ оноє. а таѧ гинєтъ. 14.6.1 Рєчє Алеѯандръ: приводы нєзнатїѧ правды үєтыре. ā. сє глѳбина єѧ краткимъ разѫмомъ .b̃. нєпорѣднєю разѫма .g̃. ищѳүи пєрємоганїѧ и паньства .d̃. любѧ то в үємъ привыкъ. 14.6.2 а то наиболшаѧ завада ниже котораѧ инаѧ. 14.7.1 а сїи исполнєнїа нє могѳтъ быти, нєжєли

и с съвѣтскою мⁿростїю, а оставлѧа всѧ лишнєѧ. 14.7.2 ꙗкѡже рєчє дв҃дъ цр҃ь. блиᶻ гд҃ь ко всѣмъ призывающимъ єго. всѣмъ єжє призываєтъ єго по правдѣ.

14.5.1 The seventh wisdom is Theology, *which is the crowning of all seven as well as their core in importance.* 14.5.2 *For through it will the human soul survive in eternity.* 14.5.3 *And this will admit a man of any creed, that he who is ignorant, cannot be with the Lord.* 14.5.4 *And this is as if one said: I serve the prince, but who that prince is I do not know; or: I go to church, but where that church is I do not know.* 14.5.5 *And these seven wisdoms are not in accordance with any religion, but rather in accordance with humanity.* 14.5.6 *And a man of any creed can embrace them. As we see that in all creeds the jurist resembles the keeper of the treasury, whereas the thinker resembles him who adds to it.* 14.5.7 *And to whichever thing one does not add according to it(s nature), that thing perishes.* 14.6.1 *Said Alexander (Aphrodisiensis): The reasons for the ignorance of truth are four. 1. Its depth for the short mind, 2. the helplessness of the intellect, 3. striving to overpower and dominate, 4. cherishing that to which one is accustomed.* 14.6.2 *And this is a greater obstacle than any other.* 14.7.1 *And these accomplishments cannot come about but in combination with the Worldly Science by shedding all mean (traits).* 14.7.2 *As King David said* (Psalms 145:8): *The Lord is near unto all who call upon him, to all who call upon him in truth.*

The passages in italics, which, as said, do not come from Maimonides' *Logic*, could be most revealing about the ideology and perspective of the person or persons, assumedly Jewish, who produced the Slavic translation. The ideas expounded in these passages are typical of the Jewish rationalists, disciples and followers of Maimonides, who for three centuries had been fighting a hopeless retreating battle against fundamentalist and mysticist tendencies which were gaining ground in mainstream Judaism, while marginalizing and delegitimizing rationalism as alien to orthodox Jewish thought.[5] Essentially, they draw upon the traditional sources of reference, ultimately the Bible and the Talmud, skillfully using citations that had served in the past in discussions over Wisdom and Faith (see the detailed analysis in Taube 1997).

It is obvious, then, that in this afterword the translator of the *Logic* added into the text an ideological *credo* of a progressive and universalist, indeed cosmopolitan nature, which he thought would please his audience. But who was his audience?

The Addressees of the Translations

Speculations were advanced by several Russian and Ukrainian scholars that the translations were carried out for internal Jewish or "Synagogal" purposes (e.g. Florovskii 1981:13). These speculations are absurd, though Luria (1995a: 218) seems to accept them without his usual skepticism. His statement that Altbauer

5 For a recent survey of the final stages of this battle, culminating in sixteenth-century Poland in the polemic between the rationalist Moses Isserles and his opponent Solomon Luria, a polemic that ended with the victory of the anti-rationalist Luria, see D. B. Ruderman 1995, ch. 1–2.

has convincingly corroborated this hypothesis by citing "direct contemporary testimonies" to the effect that in Lithuania "it is the habit of our coreligionists to speak mostly Russian" is unfounded.

Indeed, Jews in all their places of dispersion acquired the local tongue and spoke it. There is a great distance, however, between speaking and writing. Altbauer himself (1992: 20) states: "it is highly unlikely that Jews in Belorussia in that period generally were able to read texts not in Hebrew characters." Our texts – whether on Astronomy, Logic, Theology, Sex or Medicine – do not belong to the kind of literature likely to be translated for under-educated Jewish men or women. This type of literature was only known to, and read by, a few highly cultivated Jewish scholars who were *ipso facto* fluent in Hebrew, and consequently did not need a translation. In short, this is not the nineteenth, but the fifteenth century, and Slavic, any kind of Slavic, cannot be considered a *Kultursprache* for Jews at this time.

Indications that the translations were intended for a non-Jewish audience interested in Jewish writings can be derived from a detailed analysis of passages in the translations where the Slavic is deliberately modified or censored, in order to remove or to rectify statements which might not be fit for a Christian audience. Thus, in the Logical section of Al-Ghazālī's *Intentions*, in the discussion of the difference between true negation (i.e. negation of the nexus) and privation (i.e. negation of the subject), the Hebrew text, following the Arabic original, explains that one cannot assign positive attributes to a non-specific or fictitious subject, for example "God's Associate." Now the notion of "God's Associate" presents no difficulty for a Jewish or Moslem reader, for it is immediately grasped as absurd or fictitious, due to the deeply established notion of God's unity in these two monotheistic religions. It appears however, that this notion was considered by the translator unfit for a Christian reader who might be confused by the familiar dogma of hypostasis which taught him that one deity could actually contain three.

(3.2.10 לא) ויקרא זה משפט מוסר, ר"ל הוא חיוב באמת, סר בו אל דרך השלילה, ואות זה שהשלילה תהיה אמיתית על הנעדר, ואפשר שיסולק, (3.2.10 לא) בשיאמר עושתף האל יתʿ אינו ראוי, והבטל אינו יודעת, ואי אפשר שיאמר עושתף האל יתʿ בלתי ראוי, כמו שלא יאמר עור, והוא בלשון ההמון יותר נראה.

Ultimately what we read in the Slavic version is:

(LA3.2.10) и нарєᵛтсѧ ѡсѳ᷒ї сїи ѿстѫпᵢныи понє᷎ ѿстѫпиї въимѡᴹ оу прилогъ. ‹lacuna› (ЛА3.2.11) а могомъ рєүи, бг҃ъ нє видитєль, и празднословїє нє моудрость, а нє могоᴹ рєүи бг҃ъ нє види᷎т.‹lacuna›

(LA3.2.10) and this type of proposition is called digressive, for it has digressed, being negative, into affirmation, ‹lacuna: the demonstration thereof is that the negation is true when applied to the non-existent› (LA3.2.11) and we may say *God‹'s associate›*[6] *is un-sighted*, and idle talk is not wisdom,[7] but we cannot say

6 So Heb. עושתף האל יתʿ.

7 Hebrew 'and the void is not knowledge'. Latin omits phrase.

God‹'s associate› does not see[8] ‹just as we cannot say (that he is) blind, and this is even more manifest in the vulgar tongue (i.e. Persian)›.

The translator into Slavic consequently twice dropped the fictitious Associate and left God to reign alone, thus distorting the whole sense of the passage.

A second example is from the Theological section of Al-Ghazālī's *Intentions*. Here too the issue is unity.

(3.1.1 תא) והאחד באמת הוא החלק המעריך, ואבל הוא על שלוש מדרגות: (3.1.2 תא) הדרגה הראשונה, והיא האמתית באמת, הוא החלק האחד אשר אין רבוי בו לא בכח ולא בפעל, (3.1.3 תא) וזה כנקודה ועצמות הבורא, כי הוא אינו מתחלק בפעל.

(TA3.1.1) единыи бо по истинѣ сє єсть ѵасть тождєствєна ино на трєхъ стєпєнєхъ. (TA3.1.2) ā. оноже по истинѣ в нєᴹже нѣсть множєство ни в силѣ ни в дѣлѣ. (TA3.1.3) и сє ꙗко самость сотворитєлєва нєраздѣлима ни в силѣ ни в дѣлѣ. (TA3.1.4) такоже ‹нє пр҃иимаєтъ› множества возможєнствомъ и прємѣнєнїа и в силѣ и в дѣлѣ, (TA3.1.5) онже єсть єдиныи по истинѣ.

(TA3.1.1) 'One' in the proper sense is (that which is) part(icular and) concrete, and this (occurs) in three degrees: (TA3.1.2) First, which is truly (one), is that in which there is no plurality neither potentially nor actually. (TA3.1.3) And this is, e.g. ‹the point and› the essence of the Creator which is not divisible, neither in potential nor *in actu*.

The Hebrew here, like the Arabic original, brings as examples of "true unity," divisible neither in reality nor in thought, the point and the essence of the creator. This equation apparently seemed to the translator to be unfit for the Christian reader, and he consequently dropped the point from the example and left only God.

Further corroborating evidence for the claim that the translation was intended for a non-Jewish audience, and that the translator had a particular tendency in mind, is the fact that in the Slavic version of *Logika* the translator tried to dissimulate the Moslem origin of Al-Ghazālī's *Intentions* by erasing any trace of Arabic. This was done either by simple deletion, or by replacing names of places and persons, including the name of the author, by Jewish names, so that by reading the Slavic text alone one might have the impression of reading a Jewish work. Thus the name of Al-Ghazālī, which appears in the Arabic and Hebrew versions as "Abū-Ḥāmid," is Judaized in the Slavic version into 'Aviasaf,' while Zayd and 'Umar, which remained Zayd and 'Umar in Hebrew, were converted in Slavic into Abraham and Isaac. This deliberate dissimulation leaves no doubt about the tendentiousness of the translation. The Jewish translator desired to present to the non-Jewish readership an attractive picture of Judaism, as a culture which combines faith with rationality, openness and progress. This desire was so strong that he did not abstain from annexing a Moslem thinker *par excellence* like Al-Ghazālī to the Jewish heritage.

8 Arab and Hebrew have it the other way around: 'we may say *God's associate does not see*... but we cannot say *God's associate is un-sighted*'.

Yet this picture of Judaism which the translator wishes to present certainly does not correspond to reality. In the fifteenth century, after three hundred years of controversy over the rationalist heritage of Maimonides, its proponents are fighting a rearguard battle. Jewry in Ashkenaz and in its eastern extension (Poland-Lithuania) was being overwhelmed by tendencies of fundamentalism and mysticism which marginalized the rationalist tradition and tried to de-legitimize it. The tendentiousness of the translation may thus reflect internal struggles within Judaism itself.

The link between the Ruthenian translations and the Muscovite heresy

The fact that some of the texts belonging to the "Literature of the Judaizers," such as Sacrobosco's *Book of the Sphere*, were only preserved in Ruthenian is no indicator of their being excluded from the list of texts related to the Judaizers. As pointed out by Seebohm 1977: 200, such a fact is also true for the *Six Wings*, which we know to have been in the possession of the heretics. Luria (1960: 84ff.), in his effort to dissociate the corpus of translation from the Muscovite heretical movement, points out *inter alia* that the translations were carried out in the Grand Duchy of Lithuania, whereas the heresy thrived in Novgorod and later in Muscovy. This, however, is but a natural result of the fact that Muscovy did not have a Jewish population at that time, while Lithuania did. Translators with knowledge of both Hebrew and Slavic would thus naturally come from the Ruthenian lands. The texts, as a matter of fact, ended up being copied in Muscovy, where copyists tried to russify the text. One of them added glosses,[9] trying to explain unfamiliar Ruthenian forms or unfamiliar philosophical terms rendered literally, by equivalent Russian terms taken from the philosophical works of John of Damascus. Mostly, however, these guesses were wrong.

As for Slavic sources indicating such linkage, there is the 1489 letter from Archbishop Gennadii of Novgorod to Ioasaf, ex-Archbishop of Rostov, in which he mentions the books in the possession of the heretics, among them the *Six Wings* and the *Logika*.

A more specific linkage is established through the person of Zacharia or Skhariia, the learned Jew fluent in astrology and magic, named by Iosif Volotskii as the instigator of the heresy in Novgorod. The name of Zacharia, whom I, following Bruckus (1930), identify with Zacharia Ben Aharon ha-Kohen, emerges as the copyist and glossator of several Hebrew scientific texts, the earliest of which is a Hebrew manuscript of the *Book of the Sphere* made in Kiev in 1454. This copy is the only one, to my knowledge, where the seventh "clime," of the northern hemisphere, is defined as "the clime of Russia" in accordance with the Ruthenian version published by

[9] Luria (in AFED: 145) seems to be giving the impression that there were many such assiduous readers who put glosses with equivalent terms from John Damascene's *Dialectic* in the margins. It has to be emphasized that the glosses belong to a single seventeenth-century reader, and were copied along with the text from manuscript to manuscript.

Sobolevskii (1903): клима сѣдмая и Русская (и Немецкаа) whereas all other Hebrew manuscripts have ריפיוס or ריפומש for *clima diaripheos*, usually explained as referring to the Ural Mountains. So far, I have unearthed (see Taube 1995a) five Hebrew manuscripts with texts of philosophical and astronomical content copied by this very Zacharia between 1454 and 1485, two of which carry an explicit indication of their being copied in Kiev, whereas the latest was copied in Damascus.

An almost contemporary independent testimony linking Zacharia not only to the project of translation from Hebrew, but explicitly to the *Logika*, comes from a preface to a sixteenth-century Ruthenian Psalter from the *Dukhovnaia Akademiia* in Kiev. Although the text was published by Peretts in 1906, it has so far gone unnoticed and was never brought up in the discussion about the Judaizers. Even Peretts himself, who had written extensively on the Judaizers, nevertheless failed to notice the implications of the excerpt he had published. It is manuscript # 117, Aa, 1287 (described by Petrov 1897: 213), where we find, on folia 415v–416, a list (cf. Peretts 1906: 63) of authors (or translators) and the terminology they use for the different sciences. Peretts (1906: 60) describes the list as follows: "Вслѣдъ за "предисловіемъ над псалтирь" идетъ списокъ авторовъ и, кажется, принадлежащихъ имъ сочиненій, поскольку они были извѣстны писцу; статья, содержаніе и смыслъ которой намъ пока неясенъ." ("Following the "Preface to the Psalter" comes a list of authors and, apparently, works ascribed to them, insofar as they were known to the scribe; an item, the content and intent of which is still unclear to us.") It is quite surprising that not even a single scholar has noticed that the terms ascribed here to Zacharia correspond to the ones found in the translation of the *Logika*.

The terms ascribed to Zacharia correspond to the ones found in the translation of the *Logika*. Thus, the list quoted by Peretts (1906:63) has:

	схаріа	**θома грєкь**	
	ѵислєннаа	грамотика	а
	мѣрнаа	риторика.	в
ã	спѣвалнаа	и диѡмитріа	г
ṽ	нєбєснаа	философикы	д
г	‹с›вѣтскаа	θєѡлогіа	є
в	приложєнаа	астрономіа	s
ĩ	бж^{є}твєнаа	орθографіа	ʒ́

сіѫ книгы Кири^{ĩ} философь оумѣ^{ĩ}. словѣно^{ы} слѡживыи грамотѫ: –

ã.	грамотикоу	риторикѫ	ṽ
г̃	ѡмира	арифмитикь	д̃
є̃	гиѡмєтріѫ	мѫсикіѫ	s̃
ʒ́-ѧ	астрономіѫ	и ѡсмь книгь	

лоиѵны^{х} єврєискы^{м} ѧʒыко^{м}, єжє є^{с} бєсѣдоѫ оу Лва и θотѣ.

The list in the column ascribed to Zacharia in this sixteenth-century testimony is practically identical with the one found in the afterword to the *Logika* LM14.3.1–14.5.1:

14.3.1 а пєрвал о^{т} сєдми м^{л}ростєи ѵислєнал. вторал мѣрилнал. трєтіѧ спѣвалнаѧ.[10] ѵєтвєртал нб^{с}нал 14.3.2 пѧтаѧ свѣ^{т}скаѧ. а та на ѵєтвєро пєрвоє водити дш̃ѣ свою. ѣ.-є до^{м} сво^{и}. ĩ.-є вєстиса гд^{и}рю вєликомѣ. ѯ̃.-є водити зємлю и сѣды єѧ. 14.4.1 шєстал о прирожєнїи сего[11] свѣта. а ты^{х} кни$^{г̃}$ дєсать. и мѣдрость лѣкарскаѧ по^{ц} нєю жє 14.5.1 сєдмаѧ м^{л}рость бж^{с}твєннаѧ. она єсть глава всѣ^{м} сєдми^{м}. и цадро и^{х} статоѵное.

14.3.1 The first among the seven wisdoms is **Arithmetic**, the second **Geometry**, the third **Music**, the fourth Astronomy. 14.3.2 The fifth is **Politics**, which divides into four: 1. self-governance (ethics), 2. household-governance (economics), 3. the conduct of a great lord, 4. governance of a country and its rules. <lacuna> 14.4.1 The sixth is **Physics** (literally: the nature of this world), *which has ten branches, under which is also Medicine*. 14.5.1 The seventh is **Theology**, *which is the crowning of all seven as well as the core of their purpose*.

Peretts himself, although he himself wrote several papers on the Judaizers, did not notice the significance of the passage and never commented on it. It is of the utmost significance that this sixteenth-century testimony, which does not contain anything defamatory or polemical, and which does not even mention any heresy or heretics, nevertheless attributes to Zacharia (of the heresiarch named in Iosif Volotskii's *Enlightener*) the terms we find in the *Logika*, thus explicitly ascribing to him the translation of the *Logika* and substantially corroborating the link between the Judaizers and the translations.

The link between the *Secret of Secrets* and Fedor Kuritsyn's *Laodicean Epistle*

Luria assigns great importance to the *Laodicean Epistle* (*Laodikiiskoe Poslanie*) as a source for understanding the ideology advanced by the Muscovite leader of the heretics, Fedor Kuritsyn, as this short text represents a work which he considers as the heretics' own work, since it carries the name of Fedor Kuritsyn, leader of the Moscow heretics, encrypted at the end of the *Epistle* as its presumed "translator."

I include the "Poem on the Soul," the introductory part of the *Laodikiiskoe Poslanie*, in the list of texts belonging to our corpus, since I interpret it, together with Fine, Kämpfer and Maier, as a document of Jewish provenance. I further propose an interpretation linking it to one of the texts in our corpus of Ruthenian translations from Hebrew, namely the *Secret of Secrets*. If we compare the Hebrew and the Slavic texts of the *Secret of Secrets*, we find numerous differences. The crucial one is a passage where Aristotle, the purported author, promises Alexander the

[10] P, R: воспѣвалнаѧ.
[11] P, R: всего.

Great, the purported addressee, a drawing in form of an eight-part circle which would summarize all the good advice given in this "Mirror of Princes." It is to be found at the end of section 39 of the Hebrew *Secretum Secretorum* (Gaster 1908, Hebrew text on page א"ר (11) and English translation on page 20): "And I will give thee here the wisdom of Divine philosophy **in the shape of a picture divided into eight sections**, and that will tell thee all the objects of the world, and all that refers to the governance of the world, and all their degrees and qualities, and how each degree obtains its share of right. **And I have divided this circle in such a manner that each section represents one degree, and with whichever section thou beginnest** thou wilt find all that is most precious within the circle of the wheel. And because the thoughts stand in this world opposite to one another, one above and the other below, have I arranged it to begin in accordance with the order of the world. And this likeness is the most important portion of this book and the very purport of thy request. And if in reply to thy demand I had not sent thee but this picture, it would have sufficed thee. Therefore, study it very carefully and take heed of it, and thou wilt find therein all that thou desirest, thou wilt obtain all thy wishes. And all that I have taught thee at length is contained here, like in a brief summary."

The Hebrew manuscripts have here a circle divided into eight sections with the following poem, in eight double lines:

1. The world is a garden	hedged in by sovereignty
2. Sovereignty is lordship	exalted by law
3. Law is guidance	governing the king
4. The king is a shepherd	mustering the army
5. The army are dragons	fed by money
6. Money is food	gathered by the people
7. The people are servants	subjected to justice
8. Justice is happiness	and the establishment of the world.

The same passage, including the eight-part circle, is found also in Arabic (Badawi 1954: 126ff). But in Slavic we have something quite different (Speranskii 1908: 141 = Bulanin 1984:556, with emphases supplied):

а протожє хочю ти написати **два кржги. єдинъ свѣ^{т}скіи а дроугии дх̃ов^{н}ныи. а поч^{н}ноу ти свѣ^{т}скіи с^{н}вѣто^{м}, а дх̃ов^{н}ныи дп̃ію. а ка^{ж}дыи ѳ ни^{х}. ѡс^{т}ми час^{т}єи**. а ими тобѣ завѣзвю в^{н}си ѡбыходы дос^{т}татиѧ и^{х}, а бы^{х} ти написа$^{л̃}$ толѣко два тыи к^{н}рougи. досыть єси мѣлъ на то^{м}, зан^{т}же нєвозмо^{ж}но цр̃ю из^{н}вѣс^{т}ти с^{т}вѣтьс^{т}каа. нє из^{н}вѣ^{л} дх̃ов^{н}наа. но ли бєсєдою м^{л}рою. а бєз того нє можєтьємѳ ни планєта єго. а в^{н}сє ч^{т}то поминано во к^{н}низє сєи из^{н}дол^{т}га завєзвєтсѧ во к^{н}рат^{т}цє во к^{н}рвзє си^{х} аминь. ("And therefore I wish to draw for thee **two circles, one worldly and one spiritual. And I will start for thee the worldly by 'world' and the spiritual by 'soul.' And each one of them contains eight parts.** And by means of these [circles] I will draw together for thee the entirety of their purport. And had I drawn for thee but these two circles, thou wouldst have had enough of it. For it is impossible for a king to understand worldly matters without understanding the spiritual ones, except through learned conversation, and

without that not even his star will help him. And everything which I describe extensively in this book is summarized in concise manner in these circles. Amen.")

The promised two circles are missing in Slavic. The fate of the missing 'Worldly Circle' beginning with Свѣтъ remains a mystery, but the 'Spiritual Circle' beginning with душа is obviously the "Poem on the Soul" in the *Laodicean Epistle*. In other words, I maintain that the allegedly 'Muscovite' poem attributed to Fedor Kuritsyn was in fact originally part of the Ruthenian version of the *Secret of Secrets*.

The Spiritual Circle was composed and added to the Slavic translation by the Jew who translated the *Secretum* from Hebrew into Slavic. It was subsequently appropriated and used in Muscovy (see Klibanov 1960: 333–350, Luria 1960: 174ff) in intellectual and theological controversies, with particular prominence given to its opening line about the "sovereignty of the soul" – a concept that did not figure in the original wording of the Ruthenian text, but emerged in Muscovy as a result of the text having been corrupted by Muscovite copyists unfamiliar with Ruthenian. I further assume that the circles, presented as the core of Aristotle's wisdom in matters of governance, were excised from the TT by an early reader, who followed the explicit advice in the TT to keep these secret treasures of political wisdom out of reach of unworthy eyes (Speranskii 1908:138):

но во истин҃ѣ҃ знамєнахо҃ таины раз҃вєр҃зєнє и печатлѣи притчами дабы не оупала книга нїѣа сїа в҃ ржкѣ҃ недостоиныхъ. да внєт҃а҃ изведаютъ то, ч҃то и҃ѕ҃ бг҃ъ не соудилъ вѣдати. но бы҃х то а разорилъ завѣтъ того хто҃ѫ мнє тоє ѿкры҃т҃. а тако҃ѫ та запр҃исаг҃аю, и како и мєнє заприсаг҃али ѡ сїю вѣщь. а хто оувєдавъ сїю вєщь таинꙋю. ѿкрыєтъ недостоинымъ. оущєпєнь єсть сєго свєта. и ѡного г҃с҃и сила҃м҃ оуховаи на҃с҃ сего ами҃н҃. ("But in truth we have hinted at the secrets scattered and sealed (in this book) by means of allegories, lest this book of ours fall into unworthy hands. And if they were to learn that which God has not judged them worthy of learning, I would have broken the covenant with regard to Him who revealed this to me. I too, therefore, swear you (into secrecy) just as I was sworn about this thing. And whoever, having learned this secret matter, discloses it to someone unworthy, will be cut off of this world as well as of the other, may the God of hosts guard us from him (or: from this). Amen.")

This reader may well have been Fedor himself, who preferred to reserve the Worldly Circle for the benefit of his master and protector Ivan III, whereas the Spiritual Circle, which is our "Poem on the Soul" in eight parts, he preserved in encrypted form (see for example manuscript GIM Muz. 2251, facsimile in AFED 259, where the poem is written in a basically consonantal script, with occasional vowels put in). He also added, in numerical cipher, his own name as translator, which he may well have been. We are now in a position to reconstruct with more assurance the original shape of the poem, since we know that it contains eight sections, with each section starting with the word that ended the previous section, and with each section being a definition of a term, a noun, by another noun plus extensions which may either be nominal or verbal. I therefore propose the following reconstruction:

1. Дш҃а самость властна заграда єи вѣра
2. Вѣра наказанїє ставит сѧ пророком
3. Пророкъ старѣишина исправлꙗетсѧ чюдотворенїємъ
4. Чюдотворєнїє даръ оусилѣєтъ мд҃ростїю
5. Мудрость сила єи житиє фарисѣиско
6. Фарисѣиство житєльство прокъ єго наука
7. Наука прєблажєна єю приходимъ въ страхъ божии
8. Страхъ божии начало добородѣтєли – сим въорд҃жаєтсѧ дш҃а.
1. 'Soul' is a separate substance whose constraint is religion
2. 'Religion' is a (set of) commandments established by a prophet
3. 'A prophet' is a leader authenticated by doing miracles
4. 'Miracle-doing' is a gift strengthened by wisdom
5. 'Wisdom' – its power is in a temperate way of life
6. 'A temperate way of life' – its goal is knowledge
7. 'Knowledge' is most blessed – through it we attain the fear of God
8. 'The fear of God' is the beginning of good deeds – by it is edified the soul.

Among the texts related to the Judaizers, the "Poem on the Soul" is the only "internal" text, to be distinguished from the texts originating with the detractors of the heresy, Gennadii and Iosif Volotskii, to which even the skeptic Luria (1960: 172ff) assigns great significance as source for the interpretation of the ideology of the heretics. If we have indeed succeeded in establishing the provenance of the "Poem" from the *Secret of Secrets*, then this validates Sobolevskii's characterization of the whole corpus of late fifteenth-century Ruthenian translations from Hebrew as the "Literature of the Judaizers."

A possible Jewish motivation for the translation with a possible explanation of its tendentiousness

It would seem, at first sight, that we could content ourselves with the assumption that the translations were the result of an intellectual encounter between scholars, pursuers of truth and wisdom. The Kievan Jew Zacharia and the Muscovite diplomat Fedor Kuritsyn, head of the Moscow heretics, were both uncommon figures in their respective milieus. Zacharia was a scholar interested in philosophy and astronomy, while Fedor, chief diplomat to Ivan III and his protégé, was a man who, unlike most of his contemporary countrymen, was able to meet people from different cultures and religions, had traveled abroad and was acquainted with foreign cultures. The two may actually have met, for example, in 1482, when Kuritsyn was on his mission from Moscow via the Crimea to Walachia and Hungary, or on his way back in 1486–88. Such an intellectual bond might explain why a Jew would translate for Christians philosophical and scientific literature, but it would hardly explain why he should have dissimulated their Moslem origin and presented them as Jewish. What we are looking for, then, is a motivation for the Jewish party to collaborate in this enterprise of translations. Shmuel Ettinger (1961:236, fn. 39) wondered (translation mine): "Perhaps it is

not a coincidence that Jewish "calculators of the end" too predicted the end for the year 525 [i.e. 5525 = 1492 A.D]."

A possible link between such motive and the internal struggle within Judaism can be established on the basis of a recent proposal by Michael Schneider[12] who is preparing a dissertation on Rabbi Moses ben Jacob the Second, or Rabbi Moses the Exiled, from Kiev (1449–1520). Schneider drew my attention to this important figure of Rabbi Moses, a rationalist who studied in his youth in Constantinople, in the golden and prosperous era after 1453, when it was already under Moslem rule. Now this same rationalist, interested in astronomy and philosophy, for whom works had been copied by students and followers,[13] was also a fervent mystic. He was the author of a Kabbalistic work, *Šošan Sodot* ("The Rose of Secrets"), in which he was the first to quote, as noted already by Zinberg in 1931,[14] from two Kabbalistic works written in Constantinople in the fourteenth century, the *Sefer hapli'a* ("The Book of Marvel"), and *Sefer haqaneh* ("The Book of the Staff"). The extensive quotations include passages predicting the coming of the Messiah – the "Redemption" for the year 1490, according to a Kabbalistic exegesis of Job 38: 7 (וירעו כל בני אלהים וברין יחד כוכבי בוקר) – "When the morning stars sang together and all the sons of God shouted for joy". The numerical value of the first word, ברן 'beron', is 250, i.e. 5250 from creation according to the Jewish calculus, = 1490 A.D if one does not count the initial preposition *be-*, or 252 (=1492), if one does count it. Rabbi Moses also quotes passages from these works where it is said that Jesus (אותו האיש, 'that man') knew this prediction, and that he announced for that date the end of the world – Doomsday – whereas in fact he meant the demise of the Nations and their subjugation to Israel, but was afraid to say so.[15] In this context Rabbi Moses quotes another passage from the *Book of Marvel*, where it is said that the proselytes are of a higher value for the process of Redemption than those born Jewish, "for the proselyte shed off his garment of impurity and donned a skin of purity" whereas the Jews, who were present at Mount Sinai, made the golden calf and thus "shed off the garment of God's law and donned a skin of impurity." Schneider points out that here Rabbi Moses adds an explanation of his own, Kabbalistic in nature, about the importance of the proselytes for the process of Redemption, namely that the proselytes are more important in this respect than those born Jewish, "for those who had stood before Mount Sinai were the ones who made the Golden Calf ... and destroyed the plants and were defiled by impurity" (כי העומדים בהר סיני הם בעצמם עשו העגל... וקצצו בנטיעות ונטמאו) whereas "the proselyte shed off his impure garment and brought about the union of the *Ecclesia Israel* with its partner" (ועשה חבור כ"י בבת זוגו והגר פשט בגד טומאתו). The proselytes are therefore the ones who will enable the Restoration (תיקון), the "mending of the broken vessels" which will bring about the Mystic Union necessary for the Redemption.

[12] Unpublished paper "The Movement of the Judaizers and Kabbalistic Eschatology" presented in Jerusalem in 1999.

[13] See Vienna manuscript # 183 described in Schwarz 1925: 204ff. containing *inter alia* the Hebrew version of Al-Farghānī's astronomical work copied for him in Kiev by Zacharia ben Aharon in 1468.

[14] See Zinberg 1929–37, vol. 3, 344 fn. 1.

[15] אז יבא המשיח זהו ברין יחד כוכבי בוקר וירעו כל בני אלהים ואותו האיש קדא שיעבוד האומו' תיי ישראל חורבן העולם כי יירא לבשר מפלתם כרי לדחוף אחוריו. (שושן סודות דף ריח עמוד ב')
(Then [i.e. when 5250 years will have eloped] will come the Messiah. This is (the meaning of) ברין יחד כוכבי בוקר וירעו כל בני אלהים. And that man (Jesus) called the subjugation of the Nations by Israel the Destruction of the World for he was afraid to pronounce their demise, lest they persecute him.)

The views of the leader of the Kievan community Rabbi Moses may thus point to a theological-eschatological motive for a Jewish "Mission to the Slavs" in the context of the eschatological fervor around the year 1492, and may supply the missing link for connecting the Muscovite Judaizers with the Ruthenian translations from Hebrew.

Do we have sufficient evidence for linking the mystic-rationalist Rabbi Moses with Zacharia and with the translations?

At this stage we do not have direct evidence for Kabbalistic tendencies on the part of the Kievan Jew Zacharia. We may however assume that this learned copyist, who lived in Kiev at the time of Rabbi Moses, and like him was interested in philosophy and astronomy, was close to the dominant and charismatic figure of the community leader Rabbi Moses (Vernadsky in fact says that Zacharia belonged to the circle of Rabbi Moses). That Rabbi Moses was a dominant and charismatic figure of a wealthy family is evident from the fact that already at the age of 24 he had students and followers who were copying works for him – the works preserved in the Vienna codex – among them the work copied by Zacharia in Kiev in 1468. Although the colophon does not specify that this particular work was copied for Rabbi Moses, it is nevertheless found in a codex belonging to Rabbi Moses. And although Zacharia (the earliest manuscript in his handwriting being from 1454) must have been older than Rabbi Moses who was apparently born ca. 1449, he must have been one of his circle. The charisma of Rabbi Moses shows even more clearly in the fact that only a few years after his definitive exile from Kiev in 1495 and settling in Kaffa (Theodosia) in the Crimea, he became head of the community there and introduced for the community a new canon of prayer (see Bernstein 1958), which constituted a compromise between the various components of the Jewish community, the Romaniote, the Sephardi, the Ashkenazi, the autochthonous Krimchak, and the Persian (Tat), a canon known thereafter as the Canon of Kaffa (נוסח כפא). Obviously, crafting a generally accepted consensus in matters of liturgy is one of the most difficult tasks and its achievement is a *tour de force*.

In order to provide more solid answers to this last question, we need to reread the translations from Hebrew with an eye for traces of this mixture of rationalism and Kabbalah. The first text one should start with is the *Secret of Secrets*, especially the passages not found in Hebrew. Is the rendering, e.g., of טבעיות ("Physics") by миротвореніе (מעשה בראשית), literally 'act of creation,' such an indication?

Or perhaps the rendering of טבע, 'nature, character,' in an astrological context, referring to the predetermined destiny of a man, written in his star, rendered by the Kabbalistic term искра, 'spark,' alongside with планита, 'planet,' and прожєнїе, 'nature, character,' is such an indication.

In conclusion, the delicate construct of assumptions, hypotheses and speculations presented here is based nevertheless on quite a quantity of facts, which, taken together, allow us to posit that the translations made from Hebrew by Jews who dictated them orally to Christians were intended for non-Jewish readers with an interest in (and probably sympathy for) Judaism and rationalism. I see in the "Novgorod-Moscow heretics" very likely (and in fact the only tangible) candidates for this kind of readership. There remains, however, much work to be done before we can confidently affirm (or perhaps deny) that the corpus of translations known as the "Literature of the Judaizers" was indeed meant by the Jewish translators to attract to the light of wisdom Christians thirsty for knowledge, in order to convert them to Judaism for mystical motives carefully hidden from their unsuspecting audience.

THE NAMES FOR BRITAIN AND IRELAND REVISITED[1]

GEORGE BRODERICK
Universität Mannheim

Abstract: Discussions on the provenance of the names of Britain (*Albion* and *Prydain*) and Ireland (*Ériu / Íriu*) have occupied the attention of scholars since the end of the nineteenth century down to the present day. Suggestions as to the origin have included a variety of languages ranging from Celtic to Hamito-Semitic. This article suggests a simpler solution in seeking to show that the foregoing names belong together in a single concept.

Zusammenfassung: Beiträge zur Erklärung der Namen Britanniens (*Albion* und *Prydain*) und Irlands (*Ériu / Íriu*) haben Wissenschaftler seit Ende des 19. Jahrhunderts bis zum heutigen Tag beschäftigt und haben dabei eine keltische sowie eine hamito-semitische Herkunft vorgeschlagen. Dieser Beitrag bietet eine Lösung an, die die obigen Namen in einem einfachen Zusammenhang verbindet.

Introduction

The vexed question of the names for Britain and Ireland has occupied the attention of scholars and academics from the latter part of the 19th century, if not before, down to the present day. The discussion has centred around three names, two for Britain and one for Ireland, namely (for Britain) *Albiōn* and *Prydyn / Prydein* (*Prydain*), and (for Ireland) *Ériu / Íriu*. Over the course of time new and varied perspectives on the issue, from inside as well as from outside the world of Celtic Studies, have been put forward and discussed, some more credible than others. The present paper seeks to present a slightly adjusted perspective to the above names that may help simplify matters. Before embarking on this exercise a short outline of current thinking on the matter would perhaps be of benefit. The current view on the meaning or import of these names from various accounts seems briefly to be as follows:

1. Contributions to date

1.1. *Albiōn*

Albiōn is the earliest known name for the island of Britain. It later became restricted to Scotland. An early contribution to a discussion on *Albiōn* was made by Alfred Holder in 1896 (Holder 1896: 83 s.v. *Albion*) who translated it as 'weißland' ('white land'), so called from its coastal white chalk cliffs.

> **Albiōn** n-st. 'weißland' *von seinen kreidefelsen am meer, name der ganzen brittanischen insel, später bloß Schottland*, ir. Alba, Alpa, Elbu, aus **Albiōn*, gen. Alban, d. acc. Albain, cy. Alban (Holder 1896: 83 s.v. *Albion*).

However, Julius Pokorny in 1925 (Pokorny 1925: 197) regarded the name as non-Indo-European, having nothing at all to do with Latin *albus* 'white', and suggested that it meant 'hill', from a non-Indo-European stem **alb-* 'Berg' ('mountain'):

[1] First published in *Beiträge zur Namenforschung* 44/2 (2009): 151-172. Here with minor additions and adjustments, 2020.

> *Albu* bedeutet zweifellos ‚Hügel'; es ist dasselbe Wort, das die Griechen mit *Albion* wiedergaben: urkelt. **Albiū*, Gen. *Albionos*, der älteste Name Englands [*rect.* Britanniens], der dann später auf Schottland eingeschränkt wurde. Mit lat. *albus* ‚weiß' hat der Name nichts zu tun;[2] es liegt zweifellos ein nichtindg. Stamm *alb-* ‚Berg' zugrunde, der in *Alba Longa*, den *Alba*-Namen hochge-legener italienischer Städte, *Alba* ‚schwäbische Alp', dem Namen der Alpen, usw. vorliegt (Pokorny 1925: 197).

In 1959, however, Pokorny (1959: 30), more guarded in his comment, asked how far the element *albho-* 'white' could be associated with *Albiōn* and its Welsh descendent *elfydd* 'earth, world' (or in connection with the chalk cliffs), or whether the name was of non-Indo-European provenance:

> ***albho-*** ‚weiß'. Gr. αλφός ‚weißer Ausschlag', lat. *albus* ‚weiß'; cymr. *elfydd* m. ‚Erde, Welt' aus **albíio-* [...]. Fraglich ist [...], ob oder in welchem Umfange Namen wie gall./lat. *Albiōn*, mir. *Albbu*, gen. *Alban* ‚Britannien' (zu cymr. *elfydd*? oder von den weißen Kreidefelsen?), lat. *alpes,* Αλπεις (alti montes?) und die auf ital. ligur. und kelt. Gebiete häufigen Ortsnamen wie *Alba, Albium* u. dgl. auf den Begriff ‚weiß' zurückgehen oder aber nicht idg. Herkunft sind [...] (Pokorny 1959: 30).

In 1946 T. F. O'Rahilly (1946: 385) took the view that *Albiōn* was of Celtic origin:

> The oldest name of the island of Britain is recorded by classical writers as *Albion* (Gr. Αλβίων, Αλουίων, Αλβίον). This name, which represents Celt. **Albiū*, gen. **Albionos*, has been preserved, but with altered meanings, in Irish and Welsh. Mod. Ir. *Alba* (OIr. *Albu*) means 'North Britain, Scotland'. Its Welsh counterpart *elfydd* (OW. *elbid*) has become a common noun meaning 'the earth, *terra firma*; compare OIr. *íriu* 'land, ground', which is ultimately a doublet of *Ériu* 'Ireland' (O'Rahilly 1946: 385).

Nevertheless, the association of the name with the 'coastal white chalk cliffs' seems to have prevailed as the accepted interpretation of *Albiōn* and remained unchallenged until 1990 when Wolfgang Meid (1990a: 97-119 (107-108), 1990b: 435-439), noting the hitherto accepted thesis of the name's association with the 'coastal white chalk cliffs', suggested that the reference may be more cosmological than real and offered the contrast **albio-* (the world of light above the earth), as opposed to **dubno-* (the earth with its dark depths), as a possible solution, paralleling this notion with Slavic *svjet* 'world' = 'light':

> *Albu* ist in der alt- und mittelirischen Literatur der Name für Schottland; [...]. Ursprünglich erstreckte sich der Name auf die gesamte britische Hauptinsel, wie auch Beda am Anfang seiner englischen Kirchengeschichte betont (I, 1) [...] (die Stelle geht wohl auf Plinius zurück): *Britannia Oceani insula cui quondam Albion nomen fuit* [...]. Dem Namen *Albiōn* liegt wohl das indogermanische Farbadjektiv **albho-* ‚weiß' zugrunde [...]. Nach einer älteren Theorie wäre die britannische Hauptinsel nach den weißen Kreidefelsen ihrer Küste benannt worden, vielleicht von frühen indogermanischen Einwanderern. Dass auch schon vor den Kelten indogermanische Einwanderer nach Britannien gekommen waren, dafür gibt es auch sonst Anhaltspunkte, namentlich in der Gewässernamengebung, die in der älteren Schicht vorkeltisch, aber indogermanisch ist („alteuropäische" Hydronomie nach H. Krahe).
>
> Mir ist jedoch wahrscheinlicher, dass der Name nicht eine real-topographische, sondern eine mythologische Signifikanz hatte. Im Kymrischen gibt es in poetischen Texten ein Wort *elfydd* m., das ‚Welt' bedeutet und aufgrund der kymrischen Lautgesetze auf britannisch **albiio-*, indogermanisch folglich **albhiio-*, zurückgehen muss. [...] Es scheint also, dass in einem ursprünglichen kosmologischen System **albio-* die lichte Oberwelt und **dubno-* die Erde mit ihren dunklen Tiefen, gelagert in Wasser, bezeichnete. Dass man seinen Lebensraum als „die Welt" bezeichnet, ist verständlich und hat viele Parallelen. Was die Assoziation mit ‚Licht' betrifft, sei auf slawisch *svjet* ‚Welt' = ‚Licht' verwiesen [...] (Meid 1990a: 107-108; see also Meid 1990b: 435-439).

Meid's interpretation of *Albiōn* has seemingly held sway until the present.

[2] In this respect Eric Hamp (Hamp 1992: 87) took a similar view: "[...] One will note that I see no connexion with the oronym *Alpēs* nor any secure way of relating names of rivers such as that of the Elbe".

1.2. *Prydyn / Prydein*

The generally accepted view here is that this name, noted in the Greek of Diodorus Siculus (ca. 30 BC) as Πρεττανική, variant Βρεττανική (< Βρεττανοί) (?from Pytheas ca. 325 BC Πρεταν-), coming into Latin as *Britanni*, is Celtic in origin, namely **Pritanī* (> W. *Prydain* 'Britain'), **Pritenī* (> W. *Prydyn* 'Picts, Pictland' -> OIr. *Cruithin, Cruithni* 'Picts' < PCelt. **Qriteni(i)*) (cf. Hamp 1983: 289-290). Jackson (1955: 158-160) believes the former to have been current in southern Britain, the latter in the north. As Holder (1896: 552 s.v. *Brittani*) puts it:

> **Brittanī** [...] Die griechische schreibung (von Pytheas?) *Πρεταν-*, [...] hängt nach Thurneysen und d'Arbois de Jubainville mit cy. *Prydain*, älter *Prydyn* und *Prydein* zusammen, das bei den Iren in der form *Cruithn-ig* bezeichnung der Picten-stämme ist; grundform **Qritano-* oder **Qritino-* (Holder 1896: 552 s.v. *Brittani*).

O'Rahilly (1946: 448, 450-451) expresses the situation more fully:

> The Celtic name of Britain, **Albiū* (whence Ir. *Alba*), was known to Greek writers, and is recorded as *Albion* by Pliny, who evidently drew his information from a Greek source. The Greeks more frequently referred to Britain as ἡ Πρεττανική (or Βρεττανική) 'the Pritanic (or Britanic) island'; compare the synonymous Welsh *Ynys Prydain*. The Romans invented the name *Britannia* 'the land inhabited by the Britanni' on the model of *Galli* : *Gallia* and the like; and this was borrowed as Βρεττανία by late Greek writers. The close resemblance, both in form and meaning, between **Pritanī* (Πρεττανοί) and *Britannī* suggests the question whether both names were not originally one [...] (O'Rahilly 1946: 448).
>
> The facts, certain or probable, regarding the two names may be [so stated]. **Pritanī* or **Pritenī*, the name of a people dominant in both Britain (**Albiū*) and Ireland (**Īvernā*) was borrowed by the Greeks as Πρεττανοί. The borrowing may have taken place as early as 500 BC. In the course of time new invaders from Gaul deprived the Pritani of their dominion over the south of Britain, though they retained their hold on the north of the island. Notwithstanding the encroachments of the later invaders, Britain continued to be regarded as 'the island of the Pritani' [...]. After the Roman conquest of Gallia Narbonensis ca. 121 BC, if not before [...], the Romans [may] have heard of Britain from the Gauls. The earliest Latin name for the inhabitants of Britain is *Britanni*. The two names, *Pritani* and *Britanni* both mean the same thing, viz. 'the inhabitants of Britain'. They differ in point of date; the former, in its Greek shape Πρετ[τ]ανοί, is attested, indirectly, several centuries earlier than the latter. [There] is no reason to [...] doubt that [*Britanni*] accurately represents the name of the inhabitants of Britain current among the Gauls ca. 100 BC. Accordingly we are justified in assuming that the change of *P-* to *B-* occurred neither in British or in Latin, but in Gaulish. From the Gauls the Romans [also] borrowed [...] the hypocoristic formation *Brittones*. [...] The Celts of Roman Britain adopted *Brittones* [later W. *Brython*] from the Romans as a name for themselves; but in the native names **Pritanī* and **Pritenī* they retained the *P-*, as we can see from the Welsh *Prydain* and *Prydyn*. The Gaulish change of *P-* to *B-* in *Britanni* < **Pritanī* can only be explained as the result of analogical influence [...]. [It] is not rash to suppose that Gaulish possessed not a few proper names and other words beginning with *brit-*, which might represent either IE *bhrt-* or IE *mrt-* [...][3] (O'Rahilly 1946: 450-451).

This seems to be the accepted view. However, with regard to the *P- / B-* contrast, Helmut Birkhan (2007: 32-33), regards O'Rahilly's view (that *B-* in Gaulish developed by analogy with existing names, such as *Brito-maros*, etc) as *nur eine Notlösung*. He notes:

> [...] Ist die bei Pytheas überlieferte Form Πρεττανικαί wirklich authentisch? Britannien muß ja eigentlich seit eh und je als Hauptlieferant des Zinns im Gesichtskreis der Römer gestanden haben. Auch wenn sie die Insel nicht selbst bereisten, so haben sie gewiß von Händlern ihren Namen in Erfahrung gebracht, da sie doch den wertvollen Rohstoff zur Bronzeerzeugung lieferte. Ich kann an die *ad hoc*-Annahme einer lat. phonetischen Adaption nicht glauben. Wir müssen also für *Britania* usw. eine andere Lösung suchen [...] (Birkhan 2007: 33).

[3] In Gaulish and Britonnic *mr-* fell together with *br-* at an early date, as in *Allo-broges*: (O'Rahilly 1946: 451 fn. 3; cf. also Birkhan 2007: 36).

In looking for such a solution Birkhan suggests PIE. **(s)mer-* 'grease' (cf. the North British tribe *Smertae*), with excrescent *-t *smert-*, zero grade **mrt-* > PCelt. **mrit-* > **brit-*; cf. Gaul. *-brog-* as in the Gaulish tribal name *Allo-brog-es*, W., Bret. *bro*, but OIr. *mruig* 'piece of land' (germ. **markō* ‚mark'). And so using **kʷritanī* as a model *Britani* would have a similar meaning? That is to say, *Britani* would mean 'those who smear themselves with paint, grease, anoint themselves, etc.

> ***Britani*** Idg. **(s)mer-* ‚Schmer', mit *-t-* Ableitung **smert-*, Schwundstufe **mrt-* > urkelt. **mrit-* > **brit-*; vgl. gall. *-brog-* in [kelt. Stammname] *Allo-brog-es*, kymr., bret., *bro*, aber: air. *mruig* ‚Landstück' (germ. **markō* ‚Mark'). Nach dem Vorbild von **kʷritanī* bedeutungsähnliches *Britani* ? (Birkhan 2006: Hand-out; 2007a: 35).

With regard to the meaning, the hitherto accepted derivation of **Pritanī / *Pretanī* is 'figured folk, tattooed folk' from PIE **qrt-* 'cut' (Latin *curtus*, Ir. *cruth*, W. *pryd* 'form, shape' < PCelt. **kʷritu-*, PIE **kʷr̥tu-* (cf. Meid 1990a: 109), seemingly dating from the time of Thurneysen and de Jubainville, as noted by Holder (1896: 552 s.v. *Brittani*), still holds sway today.

1.3. *Ériu / Íriu*

So far as is known, one of the first to venture into this area was John Rhŷs in 1875 (Rhŷs 1873-75: 196). He links the name with PIE **pìvar,* fem. **pìvarja*, 'fat, swelling'*:*

> Now suppose this *h* [were] to represent an original *p*, then *Hérinn* might, with the assistance of Welsh *Iwerddon*, be restored to the form *Pìveriana*, which, though not very transparent, must be allowed to remind one of Πιερία traced [...] to **pìvar*, fem. **pìvarja*, 'fat, swelling' [...] (Rhŷs 1873-75: 196).

Rhŷs's argument is interpreted by Graham Isaac (2006: 1) thus:

> ***Ériu*** < Pcelt. **Īweryon* < PIE **piHuerion-* [(? = Skt. *pīvarī* 'fat' f. = Gk. πίειρα (of soil) 'fertile' < PIE **piH-uer-ih2*, so = OIr. *íriu* 'earth'. Consistent with W. *Iwerddon* (Rhŷs 1873-75: 196 [Isaac's interpretation 2006: 1]).

In commenting on Rhŷs T. F. O'Rahilly (1943: 9) noted:

> Rhys long ago suggested (RC ii, 196, and iii, 87) that OIr. *Ériu* (later *Éire*) 'Ireland', and its Welsh counterpart *Iwerddon*, might be cognate with Gr. πίειρα; IE root *pī / pĭ*). This etymology, though afterwards discounted by Rhys himself, has acquired a certain vogue [...]. The crucial weakness of this etymology is that, while it might pass as a possible explanation of *Iwerddon*, it quite fails to provide an explanation of the *ē-* of *Ériu* [...] (O'Rahilly 1943: 9).

Holder (1904: 99-100) makes the following comment:

> ****Iveriū*** nach Rhŷs und Windisch aus **Piuĕri-o* aus fem. stamm *piveriā, pīvarī,* zu air.*pīvan*, griech. π-ί(F)ων, femin. πίειρα ‚fett, die fette, fruchtbare', vgl. landesnamen Πιερία, und idg. nominal-suffix *-ien-*; nach d'Arbois de Jubainville gen. **Iuĕrĭnos*, dat. (loc.) **Iuĕrĭnĭ*, acc. **Iuĕrĭonĕm*, urir. nominat. **Iuĕrĭiu*, gen. **Iuĕrĭnnos*, dat. **Iuĕrĭnnĭ*, acc. **Iuĕrĭnnen* ; air. nominat. *Ériu*, f. *Hériu, Héri* ; gen. *Hérenn, Érenn, Éirenn, Éirend*, dat. *Erin*, acc. *Éirinn, Érinn* [...] cy. *Iwerddun* (*dd* für *j*), *Iwerdon* [...]; Ιέρνη, die älteste griech. form für IFέρνη, hat das ursprüngl. F verloren, vgl. Ιουέρνη, lat. Iuberna; Hiberni, Hibernia sind latinisierte formen [...] wahrscheinlich mit anlenung an lateinisch *hibernus* [...] ‚die insel Irland' (Holder 1904: 99-100) s.v. **Iveriū*).

O'Rahilly (1943: 7-10) promoted the same line but in more detail. He noted that the polity name *Érainn* "was traditionally linked with *Ériu* 'Ireland'" and that *Íriu*, originally a doublet of *Ériu*, is to be equated with **Iverijū*, W. *Iwerddon* 'Ireland':

> Ptolemy, following an earlier Greek geographer, places the Iverni (Ιούερνοι) in the south of Ireland. An older Greek form of their name was *Iernoi*, preserved in Avienus, who speaks of *gens Hiernorum* (*Ora Maritima*, 111). The Greek name for Ireland is *Iernē*, which in some later writers (e.g. Ptolemy) becomes *Ivernia*. The best known Latin name of Ireland, *Hibernia*, employed by Caesar, Pliny and Tacitus, is a modification of *Ivernia* under the influence of *hībernus* 'wintry' [...]. In Irish tradition a people known as *Érainn* [...] are, like Ptolemy's Iverni, connected especially with the south of Ireland [...]. Also, just as the name *Iverni* is obviously connected with *Ivernia* 'Ireland', so the name *Érainn* was traditionally associated with *Ériu* 'Ireland'. Hence there is a very strong initial presumption that *Érainn* and *Iverni* are two closely related names for the one people [...].
>
> [*Érainn*] stands for Celt. **Ēvernī*, which in OIr. would give **É'rn* (earlier **Évirn*) [...], the word became in Mid. Ir. *Érainn*, gen. *Èrann* [...]. Pokorny (KZ xlvii, 233ff) has pointed out that the Irish name [*Ériu*] can only go back to **Ēverijū* [Lat. *Evernia, Ebernia* in Adamnan's Vita S. Columbae]. On the other hand, we may safely equate OIr. *íriu*, gen. *írenn*, 'land' with **Iverijū*, W. *Iwerddon*; originally a doublet of *Ériu* 'Ireland', *íriu* acquired the general sense of 'land, ground', just as **Albijū* 'Britain' (OIr. *Albu*, id.) has in Welsh *elfydd* acquired the sense of 'land' (O'Rahilly 1943: 7-10).[4]

However, in 1925 Pokorny (1925: 202) held *Ériu* to be derived from PCelt. **Ēverjō*, PIE **epi-ver-jō*, and took the name to mean 'raised land free from water between swamps', i.e. 'an island'.

> [...] Ich möchte nun, vorausgesetzt dass *Ériu* kein vorkeltischer Name ist, versuchen, eine Etymologie des Namens vorzuschlagen. Die älteste Form muss als *Ēverjō* angesetzt werden, wie ich KZ 47, 233 gezeigt habe, und als Bedeutung kommt ‚Hügel, geschützte Anhöhe' in Frage. Da nun Pedersen (Vergl. Gramm. II 551, 653) auch fürs Irische die idg. Präposition **epi* nachgewiesen hat, dürfen wir unbedenklich *Ēverjō* auf idg. **epi-ver-jō* zurückführen; die Wurzel *ver* ‚umschliessen' liegt auch in ahd. *warid*, nhd. *Werder* vor, mit genau derselben Bedeutung, die ich für *Ériu* annehme: ‚erhöhtes, wasserfreies Land zwischen Sümpfen', daher Insel [...]. Dazu kommt noch, dass Irland eine weite Ebene darstellt, die ringsumher an den Rändern von Bergen eingeschlossen ist. Lautlich ist die Gleichung jedenfalls unanfechtbar (Pokorny 1925: 202).

In 2000 Patrizia de Bernardo-Stempel (2000: 102), returning to the "*pīvarī*" thesis, noted the following:

> Ιουερνις ‚the fertile place', a town in the Gulf-Stream-exposed south of Ireland, contains - as an original **(p)iwer-n-ĭ-s* - that same heteroclitic nominal base **pīwer/n-* 'fat' from which the Irish common noun for 'soil, land, earth' (OIr. *íriu* gen. *írenn*) originated (IEW: 793f.) [...] (de Bernardo-Stempel 2000: 102).

The "*pīvarī*" thesis (for want of a better term), seemingly first muted by Rhŷs (1875), has essentially been accepted down to the present, cf. also Peter Schrijver (1995)[5] and Graham Isaac (2006).

Latterly Graham Isaac sought to show that in Welsh tradition *Ywerddon* originally equated with *Ériu* and *Iwerddon* with *Íriu*.

> In medieval Welsh inherited appellative[s] **iwerddon* and *Ywerddon* 'Ireland' were crossed, the form *Iwerddon* (in 14th century) eventually coming to dominate for 'Ireland', while appellative **iwerddon* came to survive only in LNN, understood folk-etymologically as *Y Werddon* 'The Greenery' [...] (Isaac 2006: 3).

He took *Ériu* to be a development of PIE **h₁epi-h₂uer-io-* (adj.) meaning 'on, upon, at, by, near, of the water, stream', supplying Greek parallels, and with an *n*-stem formed thereon, viz. **h₁epi-h₂uer-io-n-* to mean 'place on, upon, at, by, near the water, stream', or alternatively from Celt. **eiweryon-* < **epiwer(r)yon-* < **h₁epi-h₂uer-s-ion-* meaning 'place *par excellence* on which it rains'?:

[4] However, see Hamp (1983: 291) §2.3. below.

[5] Semantically and formally similar, noted Schrijver (1995: 288), is W. *elfydd* (f/m) 'world, earth', OIr. *Albu* (f *n*) 'Britain, Scotland' < **albiiū*.

(Y) Werddon in W LNN < appellative **iwerddon* 'fertile place, fertile earth' < Celt. **īweryon-* < PIE **piH-uer-ih2-(on-)* = Skt. *pīvarī* 'fat' f. = Gk. πίειρα 'fat, fertile' = OIr. *íriu* 'earth', as distinct from MW *Ywerdon* 'Ireland' < **ēweriyon-* < Celt. **eiweryon-* < PIE **h1epi-uer-ion-* = OIr. *Ériu*.

**h1epi-h2uer-io-* adj. 'on, upon, at, by, near, of the water, stream' (Type Gk. ἐπίγειος 'on or of the earth', ἐπιθαλάσσιος 'lying on the shore', ἐπιπόντιος 'upon the sea', ἐπιποτάμιος 'on or by the river', etc).

n-stem formed thereon **h1epi-h2uer-io-n-* 'place on, upon, at, by, near the water, stream' > Celt. **eiweryon-*. Alternatively: **h2uer-s-* verbal 'to rain' (*LIV* 259-60), nominal **h2uor-s-ó-* 'rain' (Skt. *varsá-*) **h2uer-s-eh2-* (Ep.Gk. ἐέρση 'dew' < **ἀέρση*), Celt. **eiweryon-* < **epiwer(r)yon-* < **h1epi-h2uer-s-ion-* 'place *par excellence* on which it rains'? (Isaac 2006: 3).

1.4. Comment[6]

1.4.1. *Albiōn*

Wolfgang Meid's (1990a/b) cosmological interpretation of *Albiōn* as 'world, light', bearing some mythological significance, presumably had the meaning of something like 'our world'. It is true that some polity names can be ideological, thus indicating how people wished to perceive themselves, e.g. the British polities *Catuvellauni* 'good (i.e. superb) in battle' (PNRB 305), *Ordouices* 'hammer-warriors' (Sims-Williams 2000: 8), the Gaulish polity *Aeduiu* 'les ardents; the valiant ones' (Dottin 1980: 90, Holder I: 65 s.v. *Aiduos*), and as such could well fit into an ideological or mythological framework. Though whether the notion of "our world" was common to the British polities as a whole, bearing in mind Caesar's comments[7] concerning inland vis-à-vis coastal polities (Caesar BG V, 12) is uncertain.

In 1992 Eric Hamp (1992: 88-89) expressed some semantic objections to Meid's thesis. He regards the forms **albio-* and **dubno-* either as near synonyms or applicable to both domains of the "upper and heavenly world" and "lower earthly world", not as opposites:

> [...] My difficulty with Meid's reconstructed semantics [...] arises in bridging the hypothesis that **albio-* once denoted the light, upper, heavenly world, while **dubno-* denoted the dark and black (**dubu-*), deep and lower (**dubni-*), earthly world, and yet these two terms turn out in the attestation accessible to us as near synonyms or else as applicable to both these different domains. This distinction becomes all the more difficult to draw when we are presented with yet another synonym *bitu-* as a plausible candidate. The case of **dubno-* in this framework is not aided if, as I (not alone) have suggested (*Studia Celtica* 12/13, 1977/78, 10) *annyf(y)n* contains the negative prefix. We need, then, a mechanism, a channel, a motivating neutralization to transport us from the oppositional duality of **albio-* ≠ **dubno-* to the inclusive *elfydd* of *kyfrwng nef ac eluyd* (R 1390, 40-1, 14th cent.). Can we manage this by a mid-term

[6] It is my view that when dealing with place-names we should perhaps bear in mind that such names are normally bestowed by people who have direct contact with the land and its coasts and inland areas, etc, such as farmers, seafarers, merchants, etc. The vocabulary usually found in place-names is relatively basic, since the idea is to differentiate between place A and place B in the simplest terms possible. In addition, the name of a given feature, whether it be a mountain, town, field, etc, implies that such a feature is different from similar examples of the same in its neighbourhood, to such an extent as to warrant the name it has received, e.g. (Gaelic) *cnoc mór* 'big hill' as opposed to *cnoc beag* 'little hill'. I take the view that, as a general rule of thumb, the more mundane the meaning of a place-name, the more credible it is likely to be; the more fanciful the interpretation, the less credible it is likely to be. In this respect the application of cognitive linguistics is clearly relevant to place-name research (cf. Ungerer & Schmid 1996, Hough 2007).

[7] *Britanniae pars interior ab eis incolitur, quos natos in insula ipsi memoria proditum dicunt, maritima pars ab eis, qui praedae ac belli inferendi causa ex Belgio transierunt (qui omnes fere eis nominibus civitatum appellantur, quibus orti ex civitatibus eo pervenerunt) et bello illato ibi permanserunt atque agros colere coeperunt* (Caesar BG V, 12).
('The inland parts of Britain is inhabited by tribes declared in their own tradition to be indigenous to the island, the maritime part by tribes that migrated at an earlier time from Belgium to seek booty by invasion. Nearly all of these latter are called after the names of the states from which they sprang when they went to Britain; and after the invasion they abode there and began to till the fields') (Edwards).

> value? e.g. *yn annwfn is eluyd. yn awr uch eluyd* (T 20.8-9, 13th cent.). If so, the British evidence seems richer and more helpful ultimately than the Irish.
>
> In that case, we seem to have in *annwfn* an intensive **ande-dubno-*. On the other hand, we have plenty of evidence that the Otherworld was **uindos* (> OIr. *find*, Welsh *gwyn*). We also know that originally **dhubh-ú-* 'black' and **dhub-ni-* 'deep' were formed from different bases that later fell fortuitously together (Hamp 1992: 88-89).

Pokorny's (1925: 197) suggestion of 'hill', as noted above, was not developed further. Indeed, it would be difficult to accept Pokorny's interpretation in the context of the hilly geography of most of the islands within the British / Irish archipelago. In view of this and of Hamp's semantic reservations, Meid's and Pokorny's interpretations would need to be treated with caution.

1.4.2. *Prydyn (Prydan) / Prydein (Prydain)*

The suggestion that **Pritanī* means or suggests 'figured or tattooed people' implies that this practice was restricted only to the people of Britain. The notion of painting or tattooing may perhaps have been subconsciously reinforced by the comment from the 4th century classical writer Claudianus who referred to the Picts as *non falso nomine Pictos* 'the well-named Picts' thus perpetuating what seems to have been Roman folk-etymology deriving the name from, or equating it with, the Latin adjective *pictus* 'painted, tattooed'.[8] However, Wilhelm Nicolaisen (1996: 5) takes the view that:

> If the Roman etymology were correct, *Pict-*, or rather *Pect-*, would go back to PIE **peik-* 'painted' but if that were so, the Celtic derivative would have lost its initial *p-*, thus leaving us with something like **-ekt-*. A *p*-Celtic *Pict* (< **Pekt-*) would, however, have started out as something like **Quekt-*, whatever that may have meant, and a meaning like 'painted' is unacceptable. The most closely related names are *Poitiers* and *Poitou* in France, which started out as *Pictones* and *Pictavi* respectively [...] (Nicolaisen 1996:5).

In addition, Helmut Birkhan (2007a: 32) demonstrates that body art was not only practised by the *Britanni*. Classical authors, he notes, make clear that the practice was fairly widespread. Pliny (*Naturalis Historia* XXII, 2) notes that the Dacians (*Daci*) and Sarmatians (*Sarmatae*) also indulged in body paint (*inscribunt*)[9] and Tacitus (*Germania* 43) tells us that the German polity the Harii, in demonstrating their fierceness, "blacken their shields and dye their bodies (*tincta corpora*)". The practice of body art is also found among Continental Celts, to judge from depictions on coins where tattooed cheeks can be seen (cf. Birkhan 2007a: 32 fn. 28). Even Meid (1990a: 109) comments that the notion that the Picts were 'well-formed, good-looking' seems to contradict the view, expressed by him, that they were pygmies and ugly-looking (*pygmäenhaft und eher häßlich*)! In view of this, the aforementioned derivation of 'figured, tattooed people' as a British preserve would also need to be treated with caution.

---

[8] The Picts are attested in historical sources as follows: *Pettar, Pettir* (Old Norse), *Pehtas, Pihtas, Pyhtas, Peohtas, Piohtas* (Old English), *Pecht* (Old Scots), *Peith-wyr* (Welsh). The name is also contained in the Pentland Firth (ON *Petlandsfjorðr*). The Ravenna Cosmography of ca. 700+ AD has *Pexa*, which, though listed as the name of a fort on the Antonine Wall, may stand for **Pectia* 'Pictland'. The cosmographer's source for northern Britain is believed to be a Severan modernisation (208-211 AD) of an official military map of Flavian times (69-96 AD), the information for which was mostly gathered during Agricola's campaigns (77-83 AD). If so, this would make *Pexa* (< **Pectia*) the earliest reference for the Picts and Pictland (Nicolaisen 1996: 5).

[9] *Inlinunt certe aliis aliae faciem in populis barbarorum feminae, maresque etiam apud Dacos et Sarmatas corpora sua inscribun*t (Pliny *Nat. Hist*. XXII, 2, quoted after Birkhan 2007:32, fn. 27).

1.4.3. *Ériu / Íriu*

Although to date a Celtic provenance for the name has been proposed, nevertheless there is no unity among Celtic scholars on any linguistic interpretation.

Pokorny's (1925: 202) suggests as a meaning for *Ériu* 'a raised piece of land free from water between swamps, an island' (see above), or (1959: 1161) 'Hügel, Insel ['hill, island']':

> air. *ferenn* (**uereno-*) ‚Gürtel', *fertae* (mir. *fert*) ‚Grabhügel' (mit Steinen verschlossen) = ags. *weorð* [‚Hof, Wirtschaft'], air. *feronn. ferann* (**uerono-*) ‚Land, Acker' (wohl ‚*umhegt'); mcymr. *gwerthyr* ‚Festung' (**uertro-*; vgl. [...] air. *vartra-* ['Schutzdamm, Deich']); hierher wohl air. *Ériu*, Gen. *Érenn*, cymr. *Iwerddon* ‚Irland' als **epi-ueriō*, Gen. *-ionos* ‚Hügel, Insel' (vgl. ahd. *werid*) nach Pokorny KZ. 47, 233, ZcP. 15, 197ff. (Pokorny 1959: 1161).

These seem somewhat curious in an archipelago that is the British Isles which contains a large number of islands, a point also noted by Vennemann (1998a: 463). In addition, Pokorny's (1916: 233) view that *Ériu* goes back to PIE **uer-, ueru- urū* 'shut, protect, save', interpreting this in the context of Ireland's geography as a large plain surrounded by mountains on the edge, seems somewhat strained:

> Dazu kommt noch, dass Irland eine weite Ebene darstellt, die ringsumher an den Rändern von Bergen eingeschlossen ist [...]. (Pokorny 1925: 202).

In addition to Pokorny's etymology Rhŷs (1873-75), Holder (1904), and latterly Schrijver (1995) and de Bernardo-Stempel (2000) associate the name for Ireland with Skt. *pīvarī* 'fat' (f.) interpreting it as 'the fat, fertile place':

> W PN Iwerydd, cf. OIr. *Ériu*, íriu 'earth' < **eiuVr-iiū* or rather **īuVr-iiū* (< PIE **piHuer-*, cf. Skt. *pīvarī* 'fat' (f)); a PCl. or PIE origin of the formation is uncertain. If the connection with Skt. *pīvarī* is correct, *Iwerydd* may well be a derivation in **-ōn* > PCl. **-ū* based on the feminine stem **piHuer-ih2-*. [...] (Schrijver 1995: 288).

Nevertheless, as can be seen, Schrijver himself is not 100% certain about a PCelt. or PIE provenance for the name *Ériu* and has some doubts about the connection with *pīvarī*, thus casting doubt on a Celtic or even Indo-European provenance for *Ériu / Íriu*. Porkorny in 1925 also had similar doubts as to the Celticity of *Ériu* when he noted:

> [...] vorausgesetzt dass *Ériu* kein vorkeltischer Name ist [...] (Pokorny 1925: 202).

Finally, Graham Isaac (2006: 1-4), as we have seen, proposes two solutions for the interpretation of *Ériu*: 1. 'place on, upon, at by near the water, stream', 2. 'place *par excellence* on which it rains'. Both proposals suggest that Ireland is blessed with a lot of water and rain, implying that other islands in the area, e.g. Britain, are not so endowed, i.e. that the distinction between the two is considerable, and therefore noticeable to warrant a name of that sort. However, anyone familiar with the climate of both Britain and Ireland today would recognise that each is as much inundated with rain, water, etc, as the other. The climate seems to have been similar in antiquity, as commented on (for Britain) by the Greek geographer Strabo (64BC - ca.21AD) (*Geog*. IV, 5, 2):

> ἔστι δ' ἡ πλείστη τῆς νήσου πεδιὰς καὶ κατάδρυμος [...] ἔπομβροι δ'εἰσὶν οἱ ἀέρες μᾶλλον ἢ νιφετώδεις; ἐν δὲ ταῖς αἰθρίαις ὁμίχλη κατέχει πολὺν χρόνον, ὥστε δι' ἡμερας ὅλης ἐπὶ τρεῖς μόνον ἢ τέτταρας ὥρας τὰς περὶ τὴν μεσημβρίαν ὁρᾶσθαι τὸν ἥλιον [...] (Strabo *Geog.* IV, 5, 2)
>
> Most of the island is flat and overgrown with forests, although many of the districts are hilly [...]. Their weather is more rainy than snowy; and on the days of clear sky fog prevails so long a time that

> throughout a whole day the sun is to be seen for only about three or four hours round about midday (...) (Loeb: Jones).

Isaac's suggested interpretations for *Ériu* seem unrealistic and therefore unlikely.

2. Present proposals

Given the aforementioned difficulties with the various names, perhaps we should pause for a moment and look at the situation afresh.

2.1. *Albiōn*

With regard to *Albiōn* let us return to the basic meaning of **albho-* 'white'. The earlier interpretation, as noted by Holder (1896: 83), that the name *Albion* refers to the coastal chalk cliffs perhaps needs some slight modification. It is my view that 'white' here does not refer to chalk cliffs, but to the *white metal* (see Pokorny below) available there, namely tin (Lat. *plumbum album* 'white lead'),[10] mined in south-west Britain, mainly in Cornwall, i.e. that *Albiōn* would mean 'white metal land, white tin-land'.[11] If so, the name would seem to have been applied by early Indo-European visitors to Britain whose main interest was securing tin for the making of bronze artefacts, e.g. weapons, jewellery, etc. Pokorny (1959: 31) provides us with a parallel use of this term, albeit in a by-form, for 'tin', namely:

> Zum Ablaut: neben **albho-s* scheint eine zweisilbige Wzf. vorzuliegen in gr. αλωφός [...]. Da ferner *-bho-* ein in Farbenbezeichnungen häufiges Suffix ist (z.B. lat. *galbus*, lit. *raības* ‚bunt' neben *raīnas* [...]), ist **albhos* auf die einsilbige Wz. **al-* beziehbar und dürfte andrerseits αλωφός [...] zu lit. *aĩvas* ‚Zinn' (‚weißes Metal'), apr. *alwis* ‚Blei', russ. *ólovo* ‚Zinn' (aus idg. **al uo-?* [...]) in einem ähnlichen Verhältnis stehen [...] (Pokorny 1959: 31).

This, if correct, would suggest that the application of *Albiōn* to mean 'white metal land, white tin land', given the aforementioned parallels in eastern Indo-European languages, was early. In this context, W. F. O'Brien (1990: 289) notes the connections between south-west Britain and Munster (Ireland) and Brittany ca. 1700-1500 BC, with the Trenovissick and Carnon bronze axes providing some evidence for contact between Munster-based Stage 6 workshops and Cornish alluvial tin sources. Long distance procurement of tin along the Munster-Cornish-Breton axis may explain the distribution of Irish-influenced metalwork on the Continent auring this period (O'Brien *ibid.*). These connections would be later continued by early Indo-European settlers (hence the name *Albiōn*), then by others, e.g. Phoenicians / Carthaginians, Greeks, Gauls and Romans, etc. It was evidently Britain's mineral resources that prompted the Roman invasion of 43 AD (cf. Jones & Mattingly 2002: 179-232).[12]

---

[10] According to SOED (s.v. *tin*), tin is a "silvery lustrous malleable metal which is a chemical element, atomic no. 50, occurs chiefly in the mineral cassiterite, resists atmospheric corrosion, and is used in making alloys (e.g. bronze, pewter) and tin plate." 'Silvery lustrous' to the ordinary eye can be interpreted as 'white'.

[11] A similar explanation may also apply to the name *Belerion* (Βελέριον Diodorus Siculus V, 21; PNRB 266; applied to modern West-Cornwall), namely, 'shining metal land, tin land'. The current view as expressed in PNRB (266) associates this name with the Celtic god *Belenos* (< PIE **bhele-* 'shine') and offers 'a beacon' as a possible (but unsatisfactory) explanation.

[12] The minerals mined in Britain during the Roman period (using present-day nomenclature here for convenience) include gold (West Wales & Southwest & North Scotland), silver (Southwest England), lead (Northern & Southwest England, Central Wales), copper (Southern Scotland, Northern England, North Wales, Southwest England), zinc (Northern & Western England), tin (Southwest England), iron (Northeast, Northwest, Southwest & Southeast England), coal (England [possibly also Wales and Scotland, though not specifically stated]). Though earlier mining, particularly tin mining, activity in Britain was in the hands of the Phoenicians (cf. Diodorus Siculus above), the Romans exploited Britains's mineral

The name *Albiōn* in the course of time would become current for the whole island of Britain, irrespective of whether its original meaning was retained or not, i.e. *Albiōnes* would probably mean 'dwellers of (the land of) Albion, rather than 'tin people'. Later *Albiōn* developed into W. *elfydd* with the meaning ‘earth, world’.

2.2. *Prydyn (Prydan) / Prydein (Prydain)*

Rather than that **Pritanī / *Pritenī* mean ‘land of the figured or tattooed people’, it is suggested, in the context of *Albiōn*, that *Prydyn / Prydein* also means ‘tin-land’. This was first proposed by Vennemann (1998a: 467), based on the (Hamito-Semitic[13]) form *pretan* seemingly found in a Demotic manuscript of early first century BC date:

> [...] Der älteste Namenshinweis ist jedoch in einem demot[ischen] Pap[yrus] des frühen 1. Jt. v. Chr. zu finden. Hier ist *pretan* der Name für Zinn, das damals vermutlich von Cornwall nach Äg[ypten] eingeführt wurde (Der Kleine Pauly s.v. *Britannia*; also quoted in Vennemann 1998a: 467).

In Schulten (1950: 11) the name is described as Coptic and given as πίθραν (pithran) 'tin'.[14] If this suggestion is correct, then this name would likely have been bestowed by Phoenician merchants during the 7th-6th centuries BC and may possibly be a translation of *Albiōn*. Nothing more is known about the aforementioned Demotic manuscript, however.

That tin was mined in the Cornwall area is detailed by Greek writers. Diodorus Siculus (*Hist.* V, 22), writing ca. 30 BC, notes:

> [...], νῦν δὲ περὶ τοῦ κατ' αὐτὴν φυομένου καττιτέρου διέξιμεν. τῆς γὰρ Βρεττανικῆς κατὰ τὸ ἀκρωτήριον τὸ καλούμενον Βελέριον οἱ κατοικοῦντες φιλόξενοι [...]. οὗτοι τὸν καττίτερον κατασκευάζουσι φιλοτέχνως ἐργαζόμενοι τὴν φέρουσαν αὐτὸν γῆν [...]. ἀποτυποῦντες δ' εἰς ἀστραγάλων ῥυθμοὺς κομίζουσιν εἴς τινα νῆσον προκειμένην μὲν τῆς Βρεττανικῆς, ὀνομαζομένην δὲ Ἴκτιν; κατὰ γὰρ τὰς ἀμπώτεις ἀναξηραινομένου τοῦ μεταξὺ τόπου ταῖς ἁμάξαις εἰς ταύτην κομίζουσι δαψιλῆ τὸν καττίτερον [...]. ἐντεῦθεν δ' οἱ ἔμποροι παρὰ τῶν ἐγχωρίων ὠνοῦνται καὶ διακομίζουσιν εἰς τὴν Γαλατίαν [...] (Diodorus Siculus, *Hist.* V, 22).
>
> ('..., and at this time we shall discuss the tin which the island [of Britain] produces. The inhabitants of Britain who dwell about the the promontory known as Belerium [West Cornwall] are especially hospitable to strangers (...). They it is who work the tin, treating the bed which bears it in an ingenious manner (...). Then they work the tin into pieces the size of knuckle-bones and convey it to an island which lies off Britain and is called Ictis;[15] for at the time of ebb-tide the space between this island and the mainaland becomes dry and they can take the tin in large quantities over to the island on their wagons (...). On the island [of Ictis] the merchants purchase the tin of the natives and carry it from there across the Strait to Galatia (Loeb: Oldfather).

That this sort of name, also derived from business activity, was also in being in this area around that time is found in the Greek name *Kassiterides* (Gr. Κασσιτερίδες νήσοι ‘tin-

wealth more systematically. For fuller details see Jones & Mattingly (2002: 179-232 (map p. 179)).

[13] i.e. Mediterranean Hamito-Semitic (cf. Gensler 1993: 426).

[14] K. Sethe in Schulten (1950: 11, fn. 2) derives the Coptic name for tin from the name Britain [*Prydan*], though without explanation. For bronze and copper SOED derives the word bronze as probably from Persian *Birinj* 'brass' (SOED s.v. *bronze*) and copper from Latin *cyprium* '(metal of) Cyprus' (SOED s.v. *copper*).

[15] i.e. St. Michael's Mount. The above description fits the tidal situation here. This small island lies in the bay of Penzance directly opoosite or near to the Cornish tin mines, cf. *Muir n-Icht* 'the English Channel'. This form cannot come from *Vectis* or *Victis*, as it would have given **Ficht* in OIr., but rather from *Ictis*. PNRB 489 argues that "*Icht* derived from a learned tradition in Ireland, not from spoken British forms. All the early names of seas around Britain seem to be learned (Graeco-Latin), not British ones, and can have no popular currency [...]." and opts for *Ictis* being a miscopying of *Vectis*. For a discussion see PNRB 487-489 s.v. *Vectis*. The Isle of Wight, according to Coates (1988a: 9), was known to have been some sort of staging post for the export of tin in antiquity. Nonetheless, the description in Diodorus Siculus (above) fits the situation of St. Michael's Mount, not the Isle of Wight.

islands' (referring to the Isles of Scilly) from κασσιτέρος 'tin' (etymology unknown[16]), Lat. loanword *casseritum* 'tin') also mentioned in Diodorus Siculus (*Hist.* V, 38, 4-5):

> ὑπεράνω γὰρ τῆς τῶν Λυσιτανῶν χώρας ἔστι μέταλλα πολλὰ τοῦ καττιτέρου, καὶ κατὰ τὰς προκειμένας τῆς Ἰβηρίας ἐν τῳ ωκεανῳ νησῖδας τὰς ἀπο τοῦ συμβεβηκοτος Καττιτερίδας ὠνομασμένας. πολυς δὲ καὶ ἐκ τῆς Βρεττανικῆς νήσου διακομίζεται πρὸς τὴν κατ' αντικρὺ κειμένην Γαλατίαν, και δι τῆς μεσογείου Κελτικῆς ἐφ' ἵππων ὑπὸ τῶν ἐμπόρων ἄγεται παρὰ τε τοὺς Μασσαλιώτας καὶ εἰς την ὀνομαζομένην πόλιν Ναρβῶνα. (Diodorus Siculus *Hist.* V, 38, 4-5).
>
> ('For there are many mines of tin in the country above Lusitania and on the islets which lie off Iberia in the ocean and are called because of that fact the Cassiterides. And tin is brought in large quantities also from the island of Britain to the opposite Gaul, where it is taken by merchants on horses through the interior of Celtica both to the Massalians and to the city of Narbo, as it is called.') (Loeb: Oldfather).

A similar picture is given by Strabo (*Geog.* 2, 120):

> τούτοις δὲ τὰ ἑσπέρια τῆς Βρεττανικῆς ἀντίκεινται πρὸς ἄρκτον, ὁμοίως δὲ καὶ ταῖς Ἀρτάβροις ἀντίκεινται πρὸς ἀρκτον αἱ Καττιτερίδες καλούμεναι νῆσοι πελάγιαι κατὰ τὸ Βρεττανικόν πως κλίμα ἱδρυμέναι (Strabo *Geog.* II, 5, 15).
>
> ('The westerly parts of Britain lie opposite these headlands towards the north; and in like manner the islands called Cassiterides, situated in the open sea approximately in the latitude of Bitain, lie opposite to, and north of, the Artabrians') (Loeb: Jones).

Pliny (*Nat. Hist.* VII, 197) mentions that a certain Midacritus (i.e. Μειδόκριτος ca. 575 BC)

> *ex Cassiteride insula primus adportavit* (Pliny *Nat. Hist.* VII, 197)
> ('first imported [tin] from the island of Cassiteris'[17]) (GB).

Again Strabo (*Geog.* III, 5, 11), who also mentions Phoenician activity in the area:

> Αἱ δὲ Καττιτερίδες δέκα μέν εἰσι, κεῖνται δ' ἐγγὺς ἀλλήλων, πρὸς ἄρκτον ἀπὸ τοῦ τῶν Ἀρτάβρων λιμένος πελάγιαι; μία δ' αὐτῶν ἔρημός ἐστι, τὰς δ' ἄλλας οἰκοῦσιν ἄνθρωποι μελάγχλαινοι [...]. μέταλλα δὲ ἔχοντες καττιτέρου καὶ μολύβδου κέραμον ἀντὶ τούτων καὶ τῶν δερμάτων διαλλάττονται καὶ ἅλας καὶ χαλκώματα πρὸς τοὺς ἐμπόρους. πρότερον μὲν οὖν Φοίνικες μόνοι τῆν ἐμπορίαν ἔστελλον ταύτην ἐκ τῶν Γαδείων [...] (Strabo *Geog.* III, 5, 11).
>
> ('The Cassiterides are ten (islands) in number, and they lie near each other in the high sea to the north of the port of the Artabrians. One of them is desert, but the rest are inhabited (...). As they have mines of tin and lead, they give these metals and the hides from their cattle to the sea-traders, in exchange for pottery, salt and copper utensils. Now in former times it was the Phoenicians alone who carried on this commerce (that is, from Gades [Cadiz]) (...)') (Loeb: Jones).[18]

That the Phoenicians were active in the area of Britain (and by implication Ireland), as Pokorny (1953-54: 99) also notes, is found in reports, almost certainly available to the Greek writer Marinos of Tyre (ca. 100 AD), mentioning the voyages of discovery of the Carthaginian Admiral Himilco[19] who, after the destruction of Tartessos[20] ca. 500 BC, was seemingly

---

[16] For a discussion on the possible provenance of *kassiteros* see Schulten (1950: 10-11).

[17] The *insula Cassiteris* woudl refer to the island of Britain, as, according to Pokorny (1953-54: 98), Pliny identifies the *Kassiterides* with the British Isles.

[18] Indirect reference to such activity may be found in the Old Testament. The prophet *Ezekiel* (27, 3), in praising the Phoenicians of Tyros (Tyre), states: "O thou that art situate at the entry of the sea, which art a merchant of the people for many isles [...]"; (27, 12): "Tarshish [i.e. Tartessos] was thy [i.e. Tyre's] merchant by reason of the multitude of all kinds of riches; with silver, iron, tin, and lead, they traded in thy fairs"; (27, 25) "The ships of Tarshish did sing of thee in thy market: and thou wast replenished, and made very glorious in the midst of the seas".

[19] Himilco's exploits find mention in Rufus Festus Avienus (*fl.* 2nd half of the 4th cent. AD) *Ora Maritima* (ca. 400AD); cf. Murphy 1977, li.114-129, again 380-389 and 412-415, and KP II: 1151-52. The *Ora Maritima* in essence takes as its model a single *periplus* (sailors' manual) of 6th cent. BC date (KP II: 1151), quoting Schulten 1922.

[20] According to Schulten (1950:12, 44f.), Tartessos was already in being by 1100 BC, seemingly established by the Phoenicians of Tyre, itself founded ca. 1200 BC. After the fall of Tyre ca. 600 BC the Tartessos market was then taken over by

sent northwards to reconnoitre the route to the tin deposits available in Brittany and Cornwall. Details are given by Avienus in his *Ora Maritima* li. 108-119):

> *ast hinc duobus in sacram, sic insulam / dixere prisci, solibus cursus rati est. / haec inter undas multa[m] caespitem iacet, / eamque late gens Hiernorum colit. / propinqua rursus insula Albionum patet. / Tartes(s)iisque in terminos Oestrumnidum / negotiandi mos erat. Carthaginis / etiam coloni[s] et vulgus inter Herculis / agitans columnas haec ad[h]ibant aequora, / quae Himilco Poenus mensibus vix quattuor, / ut ipse semet re[m] probasse re(t)ulit / enavigantem, posse transmitti adserit. / [...]* (Avienus *Ora Maritima*, li. 108-119).
>
> ('But from here (the Oestrymnides islands, by Brittany), there is a two-day journey for a ship to the Holy Island (Ireland) - thus the ancients called it. This island, large in extent of land, lies between the waves. The race of Hierni inhabits it far and wide. Again, the island of the Albiones [Britain] lies near, and the Tartessians were accustomed to carry on business to the ends of the Oestrymnides. Colonists of Carthage, too, and the common folk living around the Pillars of Hercules came to these seas. Himilco of Carthage reported that he himself had investigated the matter on a voyage, and he asserts that it can scarcely be crossed in four months') (Murphy).

From that point onwards the Carthaginians seemingly controlled the trade with Brittany and Britain and Ireland. This is perhaps a convenient story to explain Carthaginian (Phoenician) presence in the area of Brittany and Cornwall,[21] but nevertheless it reinforces the view found in other reports noted above of Phoenician (trade) presence in the area of Britain and Ireland.

2.3. *Ériu / Íriu*

Likewise, as copper mining in Ireland was seemingly also "big business" (O'Brien 1987, 1990, Harbison 1988: 113-115),[22] Vennemann's suggestion (1998a: 465) that *Ériu / Íriu* derives also from Hamito-Semitic meaning 'copper island' would be appropriate in this context. Copper, as is well known, is a necessary ingredient, along with tin, for the production of bronze.[23] The Proto-Semitic form, as outlined by Vennemann (*ibid.*), viz. **'iy + we-ri'um, *iy weri'im*, would give ***íriu* in Goidelic (also Isaac 2006: 1)[24]:

> Meiner Ansicht nach ist der alte Name Irlands gebildet aus den paläosemitischen Etyma von hebr. *,-y-* ‚Insel' und akkad. *werûm, erû,* assyrisch oft *eriu(m)* ‚Kupfer, Bronze' *weri'um* (vergleiche *„weri'u(m)* ass[yrisch]"). Aus einem nach ursemitischem Schema gebildeten paläosemitischen **'y-wr'(m)* ‚Kupfer-Insel', konstruiert und vokalisiert als **'iy + we-ri'um, *iy weri'im* (Vennemann 1998a: 465).[25]

Greeks from Phocaea in Asia Minor until the destruction of Tartessos ca. 500 BC.

[21] In addition, indirect reference to such Phoenician activity may also be found in the Old Testament. The prophet Ezekiel notes: (27, 3): "O thou that art situate at the entry of the sea, which art a merchant of the people for many isles [...]", (27, 12): "Tarshish [i.e. Tartessos] was thy [i.e. Tyre's] merchant by reason of the multitude of all kinds of riches; with silver, iron, tin, and lead, they traded in thy fairs", (27, 25): "The ships of Tarshish did sing of thee in thy market: and thou wast replenished, and made very glorious in the midst of the seas (*Ezekiel* 27, 3; 27, 12; 27, 25). The Book of Ezekiel was seemingly written by one of the Jewish exiles in Babylon after the taking of Jerusalem by Nebuchadnezzar in 587 BC. The period of exile in Babylon extended from 586 to 538 BC (cf. Finkelstein & Silberman 2002: 297, 2006: 293).

[22] The amount of copper produced in the Mount Gabriel area of south-west Cork, Ire-land, during the Early Bronze Age seems to have been considerable for the time (some 370 tonnes), dating from ca. 1700-1500 BC O'Brien 1987: 68). Much of it was evidently exported (Harbison 1988: 114-115, O'Brien 1990: 269-290).

[23] According to SOED (s.v. *bronze*) bronze is described as a "brown alloy of copper with up to one-third tin, often with small amounts of other metals."

[24] For comment on the name *Ériu* see also Schrijver (2016: 77-78).

[25] The suggestion of a Hamito-Semitic (or at least a non-Indogermanic) provenance for the names for Britain and Ireland (namely, *Prydyn / Prydein* and *Ériu / Íriu*) would not be out of place in this area. Richard Coates (1988a: 12), supported by Theo Vennemann (1998b: 39), has suggested a Hamito-Semitic etymon for the name Solent and Vennemann (1998b: 40-42) etyma for both Solent and the Isles of Scilly. For additional place-names in and around Britain and Ireland which Vennemann believes to be of non-Indo-European origin see Vennemann 1998b. For comment also

However, as we have seen, the name *Íriu* in the minds of the people of Ireland was evidently regarded as a doublet of *Ériu* (O'Rahilly 1943: 10). In this context *Íriu* would therefore mean 'Ireland', and not 'land', etc.

Eric Hamp (1983: 291) was not happy with the 'doublet' thesis, however:

> [...] Rachel Bromwich adduces T. F. O'Rahilly's claim of a doublet relation for OIr. *íriu*, gen. *írenn* 'land' and *Ériu*. This is impossible within Irish, and because Welsh *Iwerddon* must be related to *Ériu* it cannot be placed in relation with *íriu*. This makes the last word particularly isolated and ambiguous (Hamp 1983: 291).

Nevertheless, as we have seen, Isaac (2006: 3) has adduced that *Iwerddon* came to dominate for *Ériu* 'Ireland' in place of *Ywerddon*, i.e. that *Iwerddon* originally equated with *Íriu*. Though *Ériu* and *Íriu* may not be reconciled phonologically, as Hamp notes, nevertheless, what is important to bear in mind here are not the linguistics of the matter, but how these names were perceived by the people of Ireland who made use of them. Namely, that both were interchangeable in the context of Ireland and as such both meant 'Ireland'.

The suggestion of a Hamito-Semitic (or at least a non-Indo-European) provenance for the names for Britain and Ireland (namely, *Prydyn / Prydein* and *Ériu / Íriu*) would not be out of place in this area. Richard Coates (1988a: 12), for example, supported by Theo Vennemann (1998b: 39), has suggested a Hamito-Semitic etymon for the name Solent *(*s-l-'m ti'-* giving *Sol'im t'-* or *Sol'im ty-* plus determiner *'*the prominent cliffs')[26] and Vennemann (1998b: 40-42) has suggested etyma for both Solent and the Isles of Scilly *(*s-l-'-m-A mag-im (*Sul'imA mag-im) '*the (numerous) rocks, cliffs').[27]

3. Conclusion

In considering the place-names *Albion, Prydyn (Prydan) / Prydein (Prydain)* and *Ériu / Íriu* the following points can be made:

1. It is here proposed that *Albiōn* 'whiteland' refers not to the white chalk cliffs but to the tin-mines in south-west Britain, and if so would mean 'white metal land, tin land', as probably also the name *Belerion*, and that the names were likely applied by early Indo-European visitors to Britain (ca. 900 BC)[28] to procure tin, thereby continuing a long tradition going back to ca. 1700-1500 BC, if not before.
2. In the same tradition *Prydyn (Prydan) / Prydein (Prydain)* is held to be a name of Hamito-Semitic origin, meaning 'tin land' and applied probably by Phoenician merchants ca.- 8th-6th centuries BC.
3. Likewise *Ériu / Íriu* is also regarded as of Hamito-Semitic provenance meaning 'copper island' and also probably applied by Phoenician traders at around the same time.
   The main advantage of this solution, if found acceptable, is perhaps its simplicity, as all the names (viz. Albiōn, Prydain, Ériu) are linked by a common factor, namely, that of metal procurement.

[26] Apparently first applied to the 'Needles' cliffs on the western end of the Isle of Wight, then later to the stretch of water between the Isle of Wight and Britain (cf. Vennemann 1998b: 38-40).

[27] For additional place-names around Britain and Ireland which Vennemann believes to be of non-Indo-European origin, see Vennemann (1998b); see now also Coates 2012.

[28] This period, according to Adams (1980: 50), saw the introduction of weapons and tools of a rather different kind from those of earlier settlers, suggesting a different type of incomer.

4. The acquisition of copper from Ireland and tin from south-west Britain and Brittany seemingly has a long history. As we have seen, the amount of copper produced in the Mount Gabriel area of south-west Cork, Ireland, during the Early Bronze Age seems to have been considerable for the time (some 370 tons), dating from ca. 1700-1500 BC. Much of it was evidently exported. As noted above, we would also need to bear in mind the connections at this time with south-west Britain and Brittany. These connections seem to have been continued into our era by early Indo-Europeans, then by Phoenicians / Carthaginians, Greeks, Gauls and Romans, etc.
5. It is not necessary for there to have been any (size of) Hamito-Semitic speaking population either in Britain or in Ireland for the names *Prydyn / Prydein, Ériu / Íriu* to be applied. These names would likely be the "trade-names" current in the Mediterranean area among merchants, etc., having a vested business interest in and around Britain and Ireland and pass accordingly into Greek and Latin as and when the need arose.
6. We would also need to bear in mind that names deriving from economic activity exist in our own time as well. We only need to think of the "Gold Coast" and "Ivory Coast" in West Africa, the "Pepper Coast" in the western part of Guinea in West Africa, and the "Spice Islands" in Indonesia, to name but a few.[29]
7. Many names for territories are applied by outsiders; the name *America*, for instance, is a prime example, without going any further through the alphabet.
8. We have noted that the traditional explanations of the names for Britain and Ireland within a Celtic framework are not all that satisfactory. A possible Hamito-Semitic (or at least non-Indo-European) provenance of such names as Solent and (the Isles of) Scilly, as we have seen, would lend support to a possible non-Indo-European origin also for the names for Britain and Ireland. In view of this, we may very well in future have to seek solutions outside the world of Celtic and Indo-European to establish the provenance of other names within and around the islands of Britain and Ireland.[30]

The Question of a Hamito-Semitic Substratum in Insular Celtic and Celtic from the West

Steve Hewitt
UNESCO

Abstract

The hypothesis of a Hamito-Semitic (or Afro-Asiatic) substratum in the Insular Celtic languages elaborated successively by Morris Jones, Pokorny and Wagner to explain striking structural resemblances between Insular Celtic and Hamito-Semitic is enjoying a revival. Linguists have generally assumed that the parallels between Insular Celtic and Hamito-Semitic are to be explained in terms of Greenbergian typology (all languages of the VSO type). However, recent work by Gensler, and also Jongeling and Vennemann, compels us to revisit the substratum hypothesis. This article presents the main contributions on the question, provides a table showing the principal points of similarity by author and language, briefly comments on each of these points, and, regretting the reluctance of substratalists to consider typological explanations, sounds a note of caution against what might be termed "substratum frenzy".

In connection with the recent interpretation of Tartessian inscriptions from the south-west of the Iberian peninsula as an early form of Celtic, a new scenario suggests itself: Phoenician may have exerted substratal influence on Tartessian, which in turn may have fed into the "Milesian" language traditionally said to have brought Q-Celtic from Iberia to Ireland; if this language also spread to Britain, that would explain the presence of "non-Indo-European" traits in Insular Celtic, P-Celtic coming subsequently directly from Gaul having acquired them from the Q-Celtic already present in Britain. Such a scenario would reconcile the two fundamental divisions between Insular Celtic (with "non-Indo-European" traits) and Continental Celtic (without) on the one hand and Q-Celtic and P-Celtic (without on the continent, with in Britain) on the other.

1. Introduction

Striking structural resemblances have long been noted between the Insular Celtic languages (divided into Goedelic – Irish Gaelic, Scottish Gaelic, Manx; and Brythonic – Welsh, Breton, Cornish) and various Hamito-Semitic (more broadly, Afro-Asiatic) languages. Few of these traits appear to have been noteworthy of the now extinct Continental Celtic languages (Gaulish, Celtiberic, Lepontic, Galatian), and they are not generally found in other Indo-European languages. This fact has led some to raise the possibility of a Hamito-Semitic substratum in the British Isles to explain their origin. Among the most prominent shared features are: VSO order; singular (apersonal) verb-marking with plural post-verbal lexical subjects; the Semiticists' "construct state" – a [HEAD [*the*-DEPENDENT]] genitive construction; "conjugated" prepostions; and oblique relatives with pronoun copies, each illustrated below in Breton and Arabic.

2. *Main authors*

Both Gensler, in his thesis (1993:57-191), and Jongeling (2000:6-64) provide extensive surveys of earlier authors on the Insular Celtic / Hamito-Semitic question. The first mention of structural similarities between Insular Celtic and Hamito-Semitic was in Davies (1621), where a number of resemblances between Welsh and Hebrew were noted. John Rhŷs (1877:189f) and subsequent works raises the possibility that pre-Aryan languages may have exerted structural influence on the Insular Celtic languages.

Morris Jones (1900) Pre-Aryan syntax in Insular Celtic reviews startling similarities between Welsh and Egyptian, including (1900:625-6) the periphrastic conjugation *be* + preposition + verbal noun: "In Welsh and Irish, although these languages retain many of the Aryan tenses, this construction is extremely common ... The three prepositions commonly used for this purpose in Egyptian are *em* 'in', *er* 'to, for', *ḥer* 'above' [= Loprieno (1995:80) *m* "in", *r* "towards", *ḥr* "on"] indicating the present, future, and perfect respectively. These correspond in use with the Welsh prepositions *yn* 'in', *am* 'for', *wedi* 'after'." He also notes the surprising parallels between Welsh *yn* and Egyptian *em*: (1) preposition "in", (2) "in" + verbal noun = progressive, and (3) predicative and adverbializing "in". Other similarities are noted with Berber, but no Semitic language is examined. He concludes (1900:639) that the resemblance

> seems to involve an intimate connection of some kind between the two families of speech in the prehistoric period, though they are probably not actually cognate. It is with Hamitic, however, rather than Semitic, that Celtic syntax is in agreement; for, as we have seen, it agrees with Berber where the latter differs markedly from Arabic, as, for instance, in the shifting of the pronominal suffix from the verb to a preceding particle … Is the influence of a Hamitic substratum to be discovered in the simultaneous development on the same analytic lines of French, Spanish, and Italian in their use of infixed and postfixed pronouns?

Pokorny (1927-1930) Das nicht-indogermanische Substrat im Irischen, his *magnum opus* on the subject, has been conveniently reduced to 64 features by Vennemann (2002:324-6). Pokorny's discursive text is often impressionistic, with numerous examples (never glossed, at best paraphrased) from Hamito-Semitic languages, as well as Cushitic, Bantu (including unseemly references (1927:137) to "*Negersprachen*" deemed "*ungemein primitiv*"), Basque, Finno-Ugric, Caucasian, etc., all grist to his substratal mill. He proposes (1927:100ff) that in a language with a strong, aristocratic literary tradition such as Irish, substratal influence may take a long time to become apparent in the written language. Pokorny continued to write on the subject throughout his life; his most concise statement of the linguistic features shared by Insular Celtic and Hamito-Semitic is (1959), where he identifies a more managageable list of 20 shared features, most of which are included in the table of shared features below. See also Pokorny (1960).

Wagner (1959) ***Das Verbum in den Sprachen der britischen Inseln*** – his main work on the Insular Celtic / Hamito-Semitic question (usefully summarized by Gagnepain (1961)), especially the third part, entitled "The linguistic geography position of the Brittonic verb", with sections on "Celtic, Berber, Basque, English and French as representatives of a North African – Western European linguistic stratum, exemplified by the structure of the verb", "The Berber verb system" and "Remarks on the Semitic verb system". He describes his basic position (see also 1981) as follows (**The Celtic invasions of Ireland and Great Britain: Facts and theories, 1987:19-20**):

> Between the fourth and sixth centuries A.D. Insular Celtic suffered revolutionary changes … As a result of it Insular Celtic developed features and grammatical categories hardly found in other Indo-European languages. They have, however, close parallels in Berber and Egyptian, the Hamitic languages of Northern Africa, as well as in Basque … The linguistic structure of Insular Celtic compels me to assume that, long before the arrival of Celtic or Belgic tribes, these islands were populated by people, who spoke languages or dialects which, from the point of view of E. Lewy's typology could be described as Hamito-Semitic, languages not necessarily connected with but of a similar type as Berber and Egyptian and, somewhat more distantly Hebrew and Arabic. For my latest position on this subject, cf. my articles of 1976 and 1982. When Celtic was adopted by pre-Celtic populations, the structure of their original language(s) began to impose itself on the language of the Celtic invaders. The result was a linguistic revolution which led to the making of the mediaeval and modern Celtic languages.

Hewitt (1985) Quelques ressemblances structurales entre le breton et l'arabe: Conséquence d'une typologie ordinale commune? was written before I became aware of the Pokorny-Wagner tradition; I assumed that the resemblances could only be typological. The similar features reviewed in that article include head-dependent typology, VSO~SVO word order (main and subordinate clauses), verb-subject agreement/non-agreement, collective/singulative, conjugated prepositions, expression of "have", the construct state genitive, compound "construct-state" adjectives, double "topic ≠ subject" sentences, relatives (restrictive, non-restrictive, on prepositional objects, on possessives), the dummy sentential pronoun, and circumstantial subordinating *and*. The chief shared feature omitted is the verbal noun, most certainly historically speaking a verbal noun in Breton, but in modern Breton it behaves like an infinitive (accusative rather than possessive object pronouns).

Gensler (1993) A typological evaluation of Celtic/Hamito-Semitic syntactic parallels examines 12 Insular Celtic or Hamito-Semitic languages plus a random sample of 58 other languages from all over the world. He identifies a set of 17 "exotic" structural features shared by Insular Celtic and Hamito-

Semitic, but not common among languages worldwide. Assigning scores for each feature in each of the 70 languages, he concludes (1993:426):

> On the basis of the sample used in this study, nothing remotely close to the full-blown Celtic/Hamito-Semitic [CHS] linguistic type recurs anywhere else in the world. The relatively few languages which are 'best matches' – actually rather poor matches – are scattered all over the globe, from the West Coast of North America to the Caucasus and New Guinea. However, the continental average score for Africa is higher than for any other continent, and drops only slightly when the CHS languages Egyptian and Berber are omitted; West Africa scores especially well, and appears especially hospitable to several of the CHS features (adpositional periphrastic, word-initial change, kin terms, inter alia). Conversely, Europe has one of the lowest average scores, and when Welsh and Irish are excluded its score drops far below that of any other continent. Celtic is thus radically out of place in a European landscape, whereas the Hamito-Semitic languages simply intensify a structural trend seen over much of Africa. A weak form of the CHS type, then, would appear to have a natural home in Africa, in particular Northwest Africa. Within Afroasiatic, the highest-scoring languages are on the Mediterranean; scores fall away in every direction, but the Chadic language Hausa (in West Africa) scores much higher than Cushitic Afar (in East Africa). The diachronic evidence, too, argues that the (weak) CHS type is something quite old in Africa: the African and Arabian case studies all show stronger CHS-ness further back in time. All this, in conjunction with the blood-type agreement between the British Isles and Northwest Africa, argues for some sort of prehistoric scenario specifically linking these two regions.

While Gensler does not claim to have proved the Hamito-Semitic substratum hypothesis for Insular Celtic, he does appear to be saying: "in the face of such statistical results, what else can it be?" He takes great care with the weighting (0, ±½, ±1) of scores for individual features, but no account is taken of the centrality or frequency of each feature within a particular language, such that pervasive features such as the genitive construction (feature 8) have the same weight as more marginal ones like the idiomatic genitive kinship constructions (feature 17). Furthermore, the languages that score highest in Gensler's table, thus most strongly exemplifying what he calls the "Celtic/Hamito-Semitic type", are the Insular Celtic languages rather than the Hamito-Semitic languages, i.e. the languages that are said to have been influenced by the Hamito-Semitic substratum which purportedly gave rise to the type. Another drawback is that possible typological explanations for some of the features (cf. remarks on the genitive construction below) are not envisaged or examined. Nevertheless, with his thorough analysis and the sheer wealth of linguistic evidence he has marshalled, Gensler has certainly put the Hamito-Semitic substratum hypothesis back on the map; all authors on the subject will henceforth need to take due account of his arguments.

Jongeling (2000) ***Comparing Welsh and Hebrew*** provides an excellent, lengthy introduction to the history of the subject. The features he surveys include VSO, head-dependent order, numerals, nominal clauses, circumstantial subordinating *and*, relatives, the verbal noun, conjugated prepositions, and the lack of a verb "*have*". He proposes (2000:149-50) an interesting variant of the substratum hypothesis:

> Supposing that the explanation of certain peculiarities of Insular Celtic are due to substratum influence, one might suppose that the same or a similar substratum has influenced some subgroupings of Afro-Asiatic [Hamito-Semitic] ... In short, this scenario would mean that we should consider Western Europe and North Africa as an old coherent area of VSO-character. The influence on the three northern Afro-Asiatic groups, Semitic, Egyptian and Berber is comparable to the influence on the Celtic sub-grouping of Indo-European ... one might suppose that Western Europe and Northern Africa once formed one great contiguous VSO area. This area was split by the incoming Indo-Europeans. The proportion of Indo-Europeans on the continent was so great that any influence of a pre-existing language was blotted out, while the number of pre-Indo-Europeans inhabitants on the British Isles was such that their influence there was felt long after they were gone from memory.

This scenario not only explains the congruity in syntax of Welsh and Hebrew but at the same time gives a reason for the lack of lexical correspondences not only between Welsh and Hebrew, but in general between Afro-Asiatic and Insular Celtic.

Vennemann sees a Hamito-Semitic substratum as having influenced Insular Celtic, and through Celtic, English. In **Atlantis Semitica: Structural contact features in Celtic and English** (2001:351) he claims: "The European Atlantic Littoral was, at the dawn of history, explored and colonized by Mediterranean, probably Palaeo-Phoenician seafarers." The main features examined in this article include the verbal noun and the related progressive construction, the English "Northern Subject Rule" reminiscent of Semitic and Celtic verb-subject agreement, and the "replacement of the sympathetic dative by the internal possessor construction" (*Jean s'est cassé le bras* vs *John broke his arm*, see feature 22 below). Explaining why what he calls the "Atlantic type" arose only in Middle English, he reiterates (2001:364) an argument of Pokorny's and Wagner's: "substratal influence originates in the lower strata of a society and usually takes centuries to reach the written language, and regularly only after a period of social upheaval." In **Semitic → Celtic → English: The transivity of language contact** (2002), in which he draws attention to circumstantial subordinating *and*, and the prevalence of tensed verb/auxiliary responsives in Celtic and English, Vennemann states:

> In my view the case is closed, the thesis of a Hamito-Semitic substratum underlying Insular Celtic being one of the most reliably established pieces of scientific knowledge there is in any empirical discipline. As Gensler has shown, the substratum really was not simply Hamito-Semitic, which is a huge family including hundreds of languages in Africa and Asia (which is why it is also called Afro-Asiatic or Afrasian), but more specifically Hamito-Semitic of the Mediterranean type, which includes Libyco-Berber, Ancient Egyptian, and Semitic. In order to stress the similarity of the substratum to this particular manifestation of Hamito-Semitic, I sometimes refer to it as Semitidic or simply Semitic.

Celtic influence on English. The idea that certain features of English may be attributable to Insular Celtic is particularly in vogue among Finnish and German scholars, cf. articles by Filppula, Klemola, Vennemann, and especially Filppula, Klemola, Pitkänen (eds) (2002) and Tristram (ed.) *Celtic Englishes I, II, III, IV* (1997-2006). This theory presupposes that the Anglo-Saxons were (thinly) superimposed on a British-speaking population which eventually shifted to Anglo-Saxon, leaving subsequent substratal structural traces in English. However, a recent study by Capelli et al. (2003) has found genetic evidence to support the more traditional picture of massive population shifts (2003:979): "By analyzing 1772 Y chromosomes from 25 predominantly small urban locations, we found that different parts of the British Isles have sharply different paternal histories." Coates (2004) casts doubt on the influence of British Celtic on Anglo-Saxon.

Typological approaches. Not all authors dealing with similarities between Insular Celtic and Hamito-Semitic languages subscribe to the substratum hypothesis. Recent papers adopting a purely typological stance include Borsley (1995), Isaac (2004), and Roberts (2004). An important methodological critique of the substratum approach is Isaac (2008).

3. *Shared features*

The table on pp.7-8 shows the main features shared by Insular Celtic and Hamito-Semitic, according to author and language. The first 17 features correspond to Gensler's (1993) shared features. These are followed by additional features identified by Morris Jones (1900), Pokorny (1927-1930, 1959), Wagner (1959), Hewitt (1985), and Jongeling (2000). Features marked with (✓) in the column for Gensler are mentioned by him, but are not central to his thesis; features 35-39 from Hewitt (1985) are given by no other author, and are purely typological in nature.

1. Conjugated prepositions. In both Insular Celtic and Hamito-Semitic, this looks historically very much like incorporation of a pronominal in the preposition, a commonplace process; in Hamito-Semitic there is a single set of endings for prepositions, possessives and objects of verbs.

2. Word order: VSO, head-dependent, prepositions. The word order typology of both families is basically verb-subject-object (VSO), with head-dependent order and prepositions. However, a number

of qualifications are in order. As suggested in Hewitt (2002b), Breton simultaneous VSO and V2 is better described as PSO (predicate-subject-object) and T2 (tense-second).

Irish and Welsh are generally considered to be classic examples of VSO order, and (apart from a strong V2 period in Middle Welsh, see Willis (1998)) show no signs of a tendency towards SVO. However, Jones & Thomas (1977), analysed Welsh as TSPO, T attaching either to an auxiliary or, if there is none, to the main verb. So which is Welsh in the case of *Mae Mair yn dysgu Cymraeg* [is^{o} Mair in learn.VN Welsh] "Mair is learning Welsh", SVO or VSO? It depends on whether for V you see as primary T the tense-bearing function (> VSO), or P the predicative function (> SVO).

Most Hamito-Semitic languages are reckoned to be VSO, with the exception of Amharic and Akkadian (both SOV). Hebrew shows a steady progression from clear VSO in the Biblical period to SVO in the Massoretic and modern periods. Similarly, Arabic is normally considered to be VSO, although, as in Breton, SVO is a common alternative order, even from the Koranic period; SVO has gained in prominence in modern times; certain styles of journalistic Arabic are reckoned to be more SVO than VSO, and some dialects, in particular Egyptian, are thought to be basically SVO, with only residual VSO effects. While the *World Atlas of Language Structures Online* (Feature 81: Order of Subject, Object and Verb) does show VSO with the Celtic and Semitic languages (Modern Hebrew and Syrian Arabic being "neutral", and other modern dialects of Arabic being predominantly SVO), the other concentrations of VSO are in the Rift Valley in Africa, Sumatra – Philippines, Central America, and the Northwest Coast of North America; central sub-Saharan Africa, where pronoun copies with oblique relatives, as in the Celtic languages, are so heavily concentrated (see below, feature 4), is strongly SVO rather than VSO.

However, in the case of Arabic VSO, another analysis is possible, with potentially far-reaching consequences for word order typology in general (cf. Hewitt 2002a, 2006): in verb-initial clauses, there are numerous and regular violations of the canonical VSO order, such as VOS, VoS (o=pronominal object), VPREPOS (PREP=preposition), VPREPOSO, VPREPOOS, and VoOS. A principle of increasing "information salience" of post-verbal nominal constituents (given, known information > new information) appears to provide a unitary account of all the observable orders, *including VSO*. Strict SO order is thus called into question for Arabic, and replaced by a strict GN (given-new) order. Languages traditionally described as VSO (however, the principle of information salience-governed word order does not appear to apply to any of the Celtic languages) or SOV (e.g. Turkish, Hindi/Urdu, Tibetan) might need to be revisited in order to see whether VGN or GNV does not provide a better account of their functioning than VSO or SOV. The *World Atlas of Language Structures Online* assumes that predicate-and-arguments word order can only be based on syntactic function – subject, object, despite the questionable universality of those concepts – and does not envisage the possibility that for some languages the primary factor may instead be information salience. The whole question of VSO is thus rather more complex than it might appear at first sight.

3. Invariable relative clause linker, not relative pronoun. The precise syntactic status of the Celtic relativizer, e.g. Breton direct (subject, object) *a*, indirect (oblique – other elements) *e* is debatable, being variously analysed as either an affirmative tense particle or a relative pronoun of sorts. The invariable Hebrew *ăšɛr* has been analysed both as a relativizer and a relative pronoun. The Arabic relative pronoun *al-ladhī* M, *al-latī* F, *al-ladhīna* M.PL, etc. agrees in gender and number with its antecedent.

4. Relative clause copying, not gapping: *the bed that I slept in it*. Yes, Breton *ar gwele a meus kousked ennañ* [the bed.M AFF I.have slept in.it.M]; Arabic *as-sarīr al-ladhī nimt fī-h* [the-bed.M REL.M I.slept in-it.M] "the bed I slept in/in which I slept". The *World Atlas of Language Structures Online* (Feature/Chapter 123: Relativization on Obliques) does show a heavy concentration of this strategy, apart from in Irish and Scottish Gaelic, in Semitic (Hebrew and Arabic) and in numerous languages of central sub-Saharan Africa, but also in Persian, Eastern Kayah Li (Thailand, Myanmar), Paamese (Vanuatu, South Pacific), and Guaraní (Paraguay, Brazil). Berber never has resumptive pronouns, only movement of the bare preposition; Old Irish is similar, but the order of relator and preposition is the reverse: Berber REL+PREP; Old Irish PREP+REL.

5. Special relative tensed verb form. This is present in Irish (*-as* vs. *-aidh*, *-ann*, etc.) and apparently in Egyptian and Berber; in Brythonic, the only modern trace is in the present relative form of the copula Welsh *sy(dd)*, Breton *so* (Modern Breton *zo*); apart from Akkadian, this is unknown in Semitic; the Berber "relative form" is commonly called a "participle".

6. Subject and object marking in verb. Yes, for both Insular Celtic and Semitic; this concerns most strongly Old Irish, Berber, and Egyptian. Object pronouns are traditionally proclitic in Celtic and postclitic in Semitic; this is not the same, however, as the true subject-and-object-marking verbal morphology of Georgian. The cliticization of object pronouns on the verb is hardly a rare trait.

7. Object marker: preverb-infix-V/V-suffix. This concerns especially Old Irish and Berber. It should be noted more generaly that pre- versus post-cliticization of object pronouns concerns many languages, cf. Romance, Serbo-Croat, etc.

8. Genitive construction: def. art. on dependent only: *house the-man*. Breton *ti ar roue* [house the king], Arabic *bait al-malik* [house the-king] "the king's house". Known as the "construct state" CS among Semiticists, this is not necessarily due to substratal influence. In the typology of genitive constructions, there is a limited number of parameters: (1) the order of head and dependent: H D or D H (VSO normally implies H D order); (2) the presence or absence of an article (on D only; on both D and H; no examples of the article on H only; all Insular Celtic and most, but not all, Hamito-Semitic languages have a definite article); (3) the relation marking may be on either H or D; and finally (4) a limited number of relator mechanisms (one or more are possible): (a) simple adjacency (H D, as in all Insular Celtic and Hamito-Semitic languages except Amharic, or D H); (b) phonetic modification of either H or D: phonetic CS marking of H in Hebrew: *bayit* "house", but *bēt ham-mɛlɛk* [house.CS the-king]; *dābār* "word", but *dăbar ham-mɛlɛk* "the king's word"; or phonetic modification of D in Berber: *agellid* "king", but *axxam (n) ugellid* [house (of) king.CS]; (c) case: GEN, DAT, OBL, etc.; (d) possessive POSS: Turkish D-GEN + H-POSS: *kral-ın ev-i* [king-GEN house-his]; (e) link particle LNK: in both Hindi-Urdu and Swahili the link agrees with H: Hindi-Urdu *laṛkā* "boy.NOM", *laṛkē kā ghar* [boy.OBL LNK_x $house_x$] "the boy's house"; Swahili: *nyumba ya mfalme* [house.CL9 LNK.CL9 king.CL1] "the king's house"; (f) adposition: preposition, postposition, cf. English *the door of the house*.

In Insular Celtic and Hamito-Semitic languages which no longer have case, the construct state is defined solely by the adjacency of the head and dependent, and the restriction of the article to the dependent. However, in both families this is probably the result of independent evolution. While Breton, Welsh, Hebrew and colloquial Arabic have no cases: Breton *dor an ti*, Welsh *drŵs y tŷ*, Hebrew *dɛlɛt hab-bayit*, colloquial Arabic *bāb al-bait* [door the-house] "the door of the house", Classical and formal Modern Standard Arabic and Irish (for some items at least) conserve case endings: Arabic *bāb-u l-bait-i*; Irish *doras an tí* [door.NOM the-house.GEN], and these help to define the genitive relation. It is only with the loss of the case endings that the [H [*the*-D]] structure becomes crucial to defining the genitive construction.

Germanic has both a compact genitive construction *the king's house*, with genitive case and only one article possible, on D, and a periphrastic construction *the house of the king* with two articles and the genitive relation expressed by the preposition *of*. While it is not obvious to ordinary English-speakers

which element the article *the* applies to in *the king's house*, other Germanic languages provide a clue: German *des Königs Haus* [the.GEN king.GEN house.NOM] or Swedish: *kungens hus* [king.the.GEN house]. It therefore seems logical to bracket the phrase as follows: [[*the king's*] *house*], which is simply the reverse of the order of the two main constituents H and D in Breton [*ti* [*ar roue*]] or Arabic [*bait* [*al-malik*]]. Indeed, in one Germanic language which has lost all genitive case-marking, the [[*the*-D] H] order actually defines the genitive relation: the highly evolved form of English found in Jamaican Creole: [[*di king*] *hoos*]. Seen in this light, the Insular Celtic genitive structure is rather less exotic than it might appear at first sight; there is little need to appeal to Hamito-Semitic for a source.

Insular Celtic and Hamito-Semitic differ with regard to adjective placement in genitive constructions. While neither Celtic nor Germanic has any problem in attaching adjectives to either or both H and D: Breton *ti bihan ar roue bras* [house little the king big] "the big king's little house", Semitic cannot do this; any adjectives go obligatorily after the genitive construct, which is more akin to a compound noun "king-house", so *bait al-malik al-kabīr* [house the-king the-big] can in principle mean either "the king's big house" or "the big king's house". Only in formal Arabic is it possible to tell which the adjective applies to, from the case-marking. The usual way of applying adjectives to both H and D is to use a longer construction with two articles and a preposition, structurally similar to the periphrastic construction *the house of the king*: *al-bait aṣ-ṣaghīr li-l-malik al-kabīr* [the-house the-little to-the-king the-big] "the big king's little house". If the genitive construction in Insular Celtic really had its origins in a Hamito-Semitic substratum, it is difficult to understand why this major structural constraint prohibiting the insertion of adjectives between H and D would not also apply in Celtic.

9. Non-agreement of verb with plural noun subject. This is a striking parallel, strongest in Welsh, Breton, Egyptian, Classical Arabic and to some extent Biblical Hebrew, in the latter two with VSO order only; in Breton also with SVO order in the affirmative, but not in the negative; not in Berber. Non-agreement is fairly common with VS order worldwide, cf. Greenberg (1966), Universal 33: "When number agreement between the noun and verb is suspended and the rule is based on order, the case is always one in which the verb precedes and the verb is in the singular." Number non-agreement with plural post-verbal subjects is lost in spoken Arabic, and was lost in Hebrew from the Mishnaic period, so those two languages have moved away from non-agreement. There was usually *agreement* with post-verbal plural subjects in Old Welsh and Old Breton, so non-agreement appears to have come in since those periods. Non-agreement appears to be even more recent in Gaelic; indeed, in some dialects, such as Munster, there is often still agreement. These are exceedingly long times for some putative substratal non-agreement to have filtered through.

10. Verbal noun, not infinitive (object in genitive, not accusative). There appears to be more of a cline than a sharp distinction between the abstract verbal noun (Arabic, Georgian *maṣdar*) and the infinitive. The criterion for distinguishing between the two is whether objects are in the genitive (verbal noun) or accusative (infinitive). With the development in Breton since the 18th century (with the exception of the SE Gwened/Vannes dialect) of true "accusative" object pronouns (etymologically "*of* + pronoun"): *ma gweled* [my seeing] > *gweled ahanon* [see.INF/VN of.me] "to see me", little now distinguishes the Breton verbal noun from the French infinitive. In Insular Celtic, only the Irish verbal noun seems truly *maṣdar*-like.

Verbal noun or infinitive?

Nominal features	Irish	Welsh	Breton	Berber	Egyptian	Arabic	Hebrew
Gender	✓	×	×	✓	–	✓	?
Article possible	✓	✓	✓	–	–	✓	?
Pron. object: possessive	✓	✓	✓>×	?	✓	✓	✓
Lexical object: genitive	✓	(✓)	(✓)>×	?	(✓)	✓	(✓)

11. Predicative particle: ***he is in a farmer***. Especially in Welsh and Egyptian, if Welsh predicative *yn* really is "in", and this has recently been challenged by Gensler (2002). The construction is "*In his farmer*" in Irish. This feature is very limited in Breton, and is marginal in Hebrew and Arabic.

12. Prepositional periphrastic: ***he is at singing***. As Comrie points out (1976:100-102), apart from Insular Celtic languages, which all have prepositional periphrastic constructions, copular locative phrases expressing the progressive are found in numerous other languages: Chinese, Georgian, Yoruba, Shona, Igbo, Kpelle, other Nigero-Congolese languages, Hindi/Urdu, Punjabi, North American Indian, etc., not to mention Icelandic, various German dialects, and Continental Scandinavian. However, no Semitic languages do this, although there is an increasing use of active participles. In Egyptian *ḥr* "on", *r* "towards", and *m* "in" are all used with verbal nouns to express a progressive. Paradoxically, the Breton progressive is much closer in force to the English progressive than the Welsh or Scottish Gaelic periphrastic constructions, which have become a general cursive (imperfective) which freely allows statives (cf. Hewitt (1986, 1990)). Indeed, there appears to be a general tendency in many languages for a parallel evolution of simple tense > specialized uses, and progressive > general imperfective.

13. Periphrastic DO: ***he does singing***. This conflates at least three distinct uses: (1) activity DO with dynamic (non-stative) VPs: (Middle) Welsh, Breton; (2) DO with NPs: numerous languages; (3) DO as an empty auxiliary: North Welsh; Breton to avert V-1 in the affirmative (also English *do* with negative, interrogative). This is not typical of Semitic.

14. Circumstantial clause ***and s PRED*** **(subordinating** ***and*****)**. This feature is typical of both Insular Celtic and Hamito-Semitic (in Berber it is possibly borrowed from Arabic): Breton *gweled neus ahanon ha me o tond er-maes* [seen he.has me.OBJ and I PROG come.INF out], Arabic *laqad ra'ā-nī wa-'anā ṭāli'* [PFV he.saw-me and I coming.out] "he saw me as I was coming out". The construction is syntactically coordinate (in both Celtic and Semitic, the order after "*and*" is always SVO), but semantically subordinate; an adversive "*although*" connotation is possible.

15. Nonfinite possible instead of finite main-clause verb. This is particularly prevalent in Welsh, followed by Hebrew (infinitive absolute), but not in Arabic. There are sporadic examples in Irish and Breton.

16. Word-initial phonetic changes (mutations), various syntactic functions. The highly grammaticalized Insular Celtic initial consonant mutations are hardly comparable to the Berber "construct state" initial changes *argaz > urgaz (wərgaz)* "man", *tamɣart > tmɣart* "town", which appear to be more akin to vowel contraction, cf. the Hebrew construct state forms described under feature 8. As formulated, this is rather too abstract a feature to be confidently attributed to substratal influence, and there are numerous instances worldwide of results of phonetic changes acquiring a grammatical function.

17. Idiomatic genitive kinship constructions: *son of X*. This is very productive in Semitic, cf. Iraqi Arabic *abu chegāyir* [father.CS cigarettes] "(street) cigarette seller". It is not typical of Brythonic; the few examples in Insular Celtic are in Irish: *mac tíre* [son land.GEN] "wolf".

18. Nominal clause (absence of copula). There is no copula in the present tense in Semitic, only in non-present (future, past) tenses. This is not the same as ellipsis of the copula in Insular Celtic, especially Welsh, and to a lesser extent Breton, in gnomic expressions.

19. Amplification of negative by noun after verb: French pas. Arabic dialects (Palestine and westwards) have developed a French-like circumfix *mā V-sh* (<*shi* "thing"); Welsh *ni V S ddim*, Breton *ne V S ked*. This is surely part of a general linguistic tendency to amplify function words that otherwise risk being lost altogether.

20. Numerals followed by singular. Yes, in Brythonic; in Irish, originally nouns after 20 and higher multiples of 10 stood in the GEN.PL; due its identity with the nom. sg. in some declensional classes, this gave rise to its reinterpretation as singular. In Semitic, yes for 11 and higher; 3-10 are followed by nouns in the plural. Numerals are followed by singular nouns in many languages, for example Persian, Basque, Hungarian, Georgian, Tibetan...

21. Prepositional expression of have. Yes, Breton is the only Celtic language to have developed a verb "have": *m-eus*, etymologically [to.me-there.is^{q}] "I have", used as an auxiliary with perfect tense and as a lexical verb "possess"; possession of definites is usually expressed with prepositional periphrasis *an arc'hant so ganin* [the money is^{q} with.me] "I have the money", as it is in the other Celtic languages, Hamito-Semitic, and many other languages worldwide.

22. Possessive he broke his arm rather than dative il s'est cassé le bras. Yes, this is true of both Insular Celtic and Hamito-Semitic; "internal" possession with a possessive, rather than "external" possession with a dative is rare in European languages, with the exception of Celtic and English, cf. Payne & Barshi (1999). It is unclear which is more common worldwide. Note that Breton requires a combination of both types (possessive + dative) where the possessor of the object is not the same as the subject (possible, but not obligatory in French):

Mae Ieuan wedi torri 'i fraich	*Mae Ieuan wedi torri braich Pedr*	(Welsh)
is^{q} Ieuan after break.VN his arm	is^{q} Ieuan after break.VN arm Pedr	
"Ieuan broke his arm"	"Ieuan broke Pedr's arm"	
Jean s' est cassé le bras	*Jean (lui) a cassé le bras à Pierre*	(French)
Jean RFL is broken the arm	Jean (to.him) has broken the arm to Pierre	
"Jean broke his arm"	"Jean broke Pierre's arm"	
Yann neus torred e vrec'h	*Yann neus torred e vrec'h da Ber*	(Breton)
Yann has.M broken his arm	Yann has.M broken his arm to Per	
"Yann broke his arm"	"Yann broke Per's arm"	

Deus 'ta heol benniged da dommañ o revrioù d' ar ffiliped (Breton)
come then sun blessed to warm.INF their backsides to the sparrows
"Come on, dear sun, and warm the sparrows' backsides"

23. Preference for parataxis (Pokorny: anreihend "stringing along"). It is unclear how such a feature, identified by Pokorny, could be measured, and if it could be demonstrated, whether it is really unique to Insular Celtic and Hamito-Semitic.

24. Basic unit word group rather than single word. Again, it is unclear how such a feature might be measured, and whether it is unique to Insular Celtic and Hamito-Semitic.

25. Subjectless sentences (impersonal constructions). Both Pokorny and Wagner list this as a common feature. This probably covers a number of distinct phenomena which need closer definition, and in any case, it is hardly unique to Insular Celtic and Hamito-Semitic.

26. No present/active participle. Yes, for Insular Celtic, but not true of Semitic at all.

27. Distinction between essential and contingent be (is/tá). Yes, in Irish (*is/tá*) and Breton (*eo/emañ*), but not in Welsh or in Semitic. Again, such a distinction is quite common worldwide.

28. States/relations expressed with N (prep-O) prep-S. Yes, cf. Irish *Tá scilling agam ort* [is.SIT^{Q} shilling with.me on.you] "you owe me a shilling", *tá tart orm* [is.SIT^{Q} thirst on.me] "I am thirsty". Felt to be very typical of IC; not particularly typical of Semitic.

29. Welsh yn, Egyptian m "in": predicative, locative, progressive. Attention was first drawn to this amazing coincidence by Morris Jones, and it is tantalizing if true. However, there is some question as to the identity of the three *yn*'s in Welsh, cf. Isaac (1994), where he proposes that progressive *yn* derives from *wnc* "close", and Gensler (2002), who claims that Welsh predicative *yn* is derived from a deictic *int*.

30. Old Irish infixed pronoun -d- identical to Berber -d-. Pokorny drew attention to this, for instance in (1959:157). Its significance is unclear.

31. Comparatives (and superlatives) predicative only, not attributive. This is especially true of Irish, but not of Brythonic or Semitic.

32. Initial focus clefts. Such structures are common across many languages.

33. Yes/no responsives with auxiliary/verb/entire clause. This is considered to be very typical of Insular Celtic (which is held by some to have given rise to English "*yes, it is*", "*no, I don't*", etc.), but is not particularly characteristic of Semitic.

34. Prepositional relative: fronting of bare preposition the bed in I slept. Only Irish and Berber have this.

35. Unmarked collective, derived singulative. This is particularly productive in Breton *blew/blewenn* and Arabic *sha'r/sha'ra* "hair/strand of hair", cf. Hewitt (1985), but less so in Welsh and Hebrew, and it is quite marginal in Irish. It is also found in other languages, such as Swahili *nywele/unywele* "hair/strand of hair".

36. Virtual complement clause vso; factual complement clause svo ~ vso. "Virtual" complement clauses of the type "I want John to come" are obligatorily VSO in both Arabic and Breton, whereas "factual" complement clauses such as "I think John will come" are obligatorily SVO in Arabic; traditionally they have been VSO in Breton, but since the 18th century, an alternative SVO order has become increasingly frequent. It is unlikely that this should be French influence because Breton never has SVO order in the "I want John to come" type, cf. Hewitt (1985). This similarity is far more likely to be typological rather than substratal in origin.

Arabic				*Breton*					
'urīd	*'an*	*yajī'*	*Zaid*	*Me*	*meus c'hŵant*	*e*	*teuffe*	*Yann*	
I.want	that	come.SUBJ.M^{Q}	Zaid	I	I.have desire	AFF	come.COND^{Q}	Yann	
"I want Zaid to come"				"I want Yann to come"					
'aẓunn	*'anna*	*Zaid*	*sa-yajī'*	*Me*	*a*	*soñj*	*din*	*e*	*teuo*	*Yann*
I.think	that	Zaid	will-come.3.SG	I	AFF	think^{Q}	to.me	AFF	will.come^{Q}	Yann
				Me	*a*	*soñj*	*din*	*(penaos)*	*Yann*	*a*	*deuo*
				I	AFF	think^{Q}	to.me	(how)	Yann	AFF	will.come^{Q}
"I think that Zaid will come"				"I think that Yann will come"							

37. Construct state bahuvrīhi adjectives (Arabic "improper annexation"). Many languages have such adjective-noun compounds, including English, cf. "*pure-hearted*", "*great-winged*" below. The construct is formed with a possessive in Celtic, but has the form of a normal construct state in Semitic; note, however, the difference in treatment of the article between Hebrew and Arabic: in Arabic, the dependent noun always has the definite article; when the compound is definite, the whole construct

state has, quite exceptionally, a definite article prefixed to it; in Hebrew, it is the article on the dependent noun that determines, in rather more orthodox fashion, whether the compound is definite or not.

un den ledan e chouk (Breton)
a man broad his nape
"a well-to-do man" (i.e. who can bear a heavy [financial] load)

rajul ṭāhir al-qalb (Arabic)
man pure the-heart
"a pure-hearted man"

ar-rajul aṭ-ṭāhir al-qalb (Arabic)
the-man the-pure the-heart
"the pure-hearted man"

nɛšɛr găḏōl kănāpayim (Hebrew, Ezek. 17:7)
eagle great wings
"a great-winged eagle"

han-nɛšɛr hag-gāḏōl, găḏōl hak-kănāpayim (Hebrew, Ezek. 17:3)
the-eagle the-great great the-wings
"the large, great-winged eagle"

38. Topic ≠ subject ("double subject" sentences). This is very common in both Breton *Per eo klañv e vab* [Per is[º] ill his son] and Arabic *Zaid marīḍ ibn-uh* [Zaid ill son-his] "Per/Zaid's son is ill"; Breton *Chirac a dalc'h e fri da voanâd: c'hwessa a ra partoud!* [Chirac AFF keeps[º] his nose to narrow.INF: sniff.INF AFF he.does everywhere] "Chirac's nose keeps getting narrower / keeps narrowing: he's sniffing everywhere [for votes]". Again, this is surely typological; it is found in numerous languages.

39. Yes/no dummy sentential pronoun: I don't know and he they came. This concerns a partial resemblance between Breton and Egyptian Arabic, cf. Hewitt (1985); the main difference is that in Breton the dummy pronoun is invariable, whereas in Egyptian Arabic it must agree in number with the subject: Breton *n-onn ked hag-eñv e oa aed ar baotred* [NEG-I.know not and-**he** AFF was gone the boys] "I don't know whether the boys went"; Egyptian Arabic *sa'al-ni humma r-riggāla mishyu* [he.asked-me **they** the-men they.went] "he asked me whether the men had gone". This is unlikely to be substratal.

4. Main shared features

The most prominent and high-frequency features shared by the Insular Celtic and the Hamito-Semitic languages are probably the following:

VSO order (feature 2). This apparently concerns both families, but there are numerous other VSO languages worldwide, even if the proportion of VSO languages is low (around 15%). Furthermore, there has been drift of varying degrees towards SVO in both Hebrew and Arabic, and also in Breton. Welsh (and to some extent even Irish) could be analysed as SVO if the predicative function is taken as being more important than the tense-bearing function for V. In the *World Atlas of Language Structures Online*, VSO does not cluster well with feature 4 (pronoun copies with oblique relatives), where many other languages partial to that strategy are strongly SVO. Finally, analysis of Arabic suggests that for that language at least, and possibly for other Hamito-Semitic languages, but clearly not for any Insular Celtic language, the basic order of the verb and its arguments is not based on the syntactic status of the arguments (subject, object: VSO), but rather on their information salience (given, new: VGN), the VGN principle economically accounting for *all* observable verb-initial orders, *including* the most frequent verb-initial order VSO.

Construct state (feature 8). The [*house* [*the-king*]] "the king's house" [HEAD [*the*-DEPENDENT]] structure is certainly one of the most striking features shared by the two families. This involves: head-dependent order; availability of a definite article; relation-marking on the dependent only; relator mechanism of simple adjacency. Historically in both families, the relation was marked on the dependent with the genitive, and to some extent continues to be so in Arabic and Irish and Scottish Gaelic. The [HEAD [*the*-DEPENDENT]] structure becomes crucial in defining the genitive construction only with the loss of case (Colloquial Arabic, Hebrew, Welsh, Breton). Finally, Hamito-Semitic allows absolutely no adjectives to be placed between the head and the dependent, whereas all Celtic languages do so freely. The two families thus appear to have arrived quite independently at this construction, which is not so exotic as might be thought: Jamaican Creole, which has lost all case-marking, has [[*di-king*] *hoos*], which is merely the dependent-head inverse of [*house* [*the-king*]].

Non-agreement with plural post-verbal subjects (feature 9). Greenberg's (1966) Universal 33 states that: "When number agreement between the noun and verb is suspended and the rule is based on order, the case is always one in which the verb precedes and the verb is in the singular." The tendency in Semitic (Arabic and Hebrew) has been to relax or lose non-agreement with plural post-verbal subjects; in the older stages of the Celtic languages (Old Welsh, Old Breton, Old Irish) number *agreement* was general; *non-agreement* has come in since the old periods, and in Irish, for instance, is still not complete, agreement being common in the southwestern dialects of Munster. Thus the trends appear to be going in opposite directions in the two families. In the negative, Breton functions exactly like Standard Arabic in both affirmative and negative: number *agreement* with preverbal subjects; *non-agreement* with post-verbal subjects.

"Conjugated prepositions" (feature 1). The apparent "conjugations" are probably historically, in both families, simply the result of a morphological process of incorporation of post-prepositional pronominals.

Pronoun copies with oblique relatives (feature 4). In addition to Insular Celtic and Hamito-Semitic, the *World Atlas of Language Structures Online* shows this strategy to be common in numerous languages of central sub-Saharan Africa, but also in Persian, Eastern Kayah Li (Thailand, Myanmar), Paamese (Vanuatu, South Pacific) and Guaraní (Paraguay, Brazil).

Verbal noun rather than infinitive (feature 10). The distinction between the two is a matter of degree, the chief polar features being: gender: yes/no; definite article possible: yes/no; pronominal object: possessive/accusative; lexical object: genitive/accusative. Only Irish and Arabic have the first option (verbal noun) for all four features; other languages are less clear-cut. Breton (mainstream KLT dialects) and Modern Spoken Welsh have reached a point at which little distinguishes the untensed citation form of the verb from the infinitive of French and English. Arabic is not moving in this direction at all; as in Georgian, for instance, its *maṣdar* is fully nominal.

Circumstantial subordinating and (feature 14). I am unaware of any other languages apart from Hamito-Semitic and Insular Celtic which have this feature.

The apparent correspondence of **Egyptian *m* "in", *r* "towards", *ḥr* "on" and Welsh *yn* "in", *am* "for", *wedi* "after"** expressing, respectively, **predicative/locative/progressive, future, perfect** (Morris-Jones and **feature 29**) is quite tantalizing, but to this level of detail concerns these two languages only, and is not widely shared by the rest of the Insular Celtic and Hamito-Semitic languages (*tar éis* "after" with a verbal noun may express the perfect in Irish, and *war* "on" with the verbal noun/infinitive may be used for a prospective in Breton).

For none of these prominent shared features is a substratal explanation demonstrably more plausible than a typological explanation or mere coincidence.

The existence of striking structural similarities between the Insular Celtic and the Hamito-Semitic languages is beyond question. However, the matter of whether this is to be attributed to substratal influence through prehistoric contact or to typological tendencies and correlations remains unresolved. Gensler's statistical approach (the low likelihood of such clustering of "exotic" features in two genetically unrelated families) is in itself skewed: by focusing on the shared features, he loses sight of the bigger picture, including all the features that are not shared by the two families. Furthermore, he has no way of accounting for the relative frequency or centrality of his various features in the languages concerned.

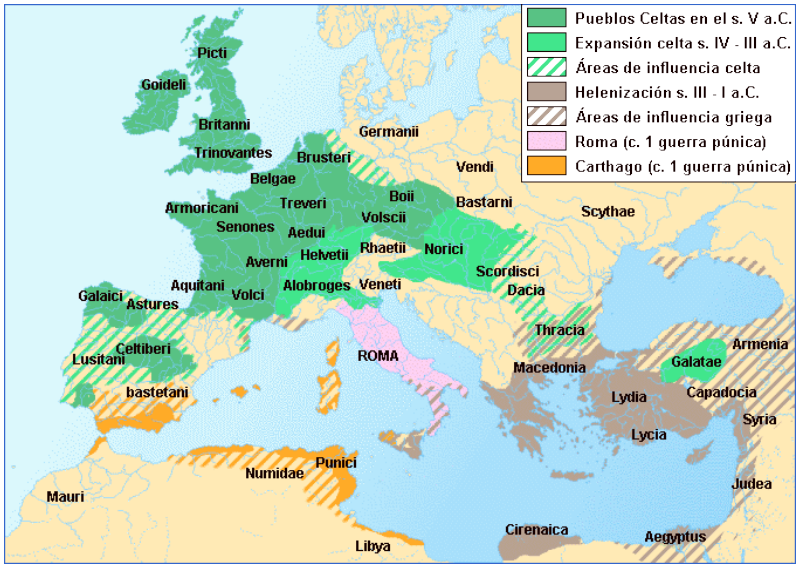
Authors inclined to a substratal explanation for the shared features appear to be prey to a kind of "substratum frenzy", as if prehistoric contact must be the only possible explanation for "un-Indo-European" traits in an Indo-European language. They pay scant attention to the possibility of typological explanations, even though, as we have seen, such explanations are perfectly plausible for many of the shared traits. With lexical items, the number of possible phonetic sequences is so vast that any significant accumulation of lexical similarities between two genetically unrelated languages can hardly be anything other than a sure sign of contact and borrowing. With structures, however, the range of possibilities across languages is far more limited – there are, for instance, only so many ways of expressing a genitive relation –, so it is less surprising for unrelated languages to possess analogous structures. It is therefore important always to bear in mind and investigate thoroughly the possibility of a typological explanation.

A major problem with the substratal explanation is the precise identity of the substratum. A subsidiary puzzle is the special affinities noted between Welsh and Hebrew (several authors, most recently Jongeling), Welsh and Egyptian (Morris Jones), Irish and Berber (Morris Jones, Pokorny and Wagner), and Breton and Arabic (Hewitt – probably typological: both SVO~VSO topic-prominent languages); in each case, however, the number of features concerned is low enough for the "special affinity" to be coincidental.

Surprisingly, Gensler's scores suggest that it is the Insular Celtic languages which are most typical of the "Celtic/Hamito-Semitic type" rather than the Hamito-Semitic languages, and this is borne out by our table of shared features by author and language, where the various features are more consistently present in Insular Celtic than in Hamito-Semitic. This is the reverse of what one would expect if the shared features really had their origin in Hamito-Semitic.

Rather than positing some Berber *Urvolk*, or Phoenician settler ghosts (who have somehow managed to leave no archaeological traces), substratalists (and it should by now be clear that I am sceptical) might take a cue from Jongeling (2000), who moots a single prehistoric substratum to both Hamito-Semitic and Insular Celtic. Such a substratum might have been centred on north-western Europe or even the British Isles, where it might have affected the incoming Celtic languages strongly, but the more distant Hamito-Semitic and North African languages less so. The identity of such a substratum would, however, perforce be so shrouded in the mists of prehistory as to be quite unknowable.

Clearly, more work is needed on both the substratal and the typological approaches to this fascinating question.



Celtic peoples during the second Iron Age

5. *Celtic from the West – Phoenician-substratalized Tartessian spreads to the Celtic Isles by a maritime route?*

It is known that Phoenician was well established at various points along the southern Iberian coast, including, in particular, at Gadir/Gades (modern Cádiz), the major Phoenician settlement nearest the area in which Tartessian emerged, from before, possibly well before 700 BCE, and continued to be spoken through the Roman imperial period.

It is therefore plausible now, for the first time, to imagine that Phoenician may have provided a substratum to Tartessian. If so, and if Tartessian is indeed Celtic, this could conceivably solve the problem of the hitherto unidentifiable substratum language which might account for "non-Indo-European" traits in Insular Celtic to the exclusion of Gaulish. This would involve several steps:

- Find typical HS/IC substratal features in Tartessian;
- Find sources/correlates for such features in Punic or Phoenician;
- Imagine a scenario (maritime route?) which would get such a substratalized Tartessian to the Celtic Isles entirely bypassing Gaul, where none of the putative HS/IC substratal features have been attested;
- Suppose that this substratalized "Milesian" language was Q-Celtic, and became prevalent both in Ireland *and* in Britain;
- Suppose that P-Celtic arrived in Britain subsequently from Gaul, and acquired its HS/IC substratal features from the Phoenician-substratalized Q-Celtic already present;
- This would resolve the Insular Celtic/Continental Celtic *vs* Q-Celtic/P-Celtic conundrum by allowing both fundamental divisions to be maintained simultaneously;
- However, long shot on multiple counts:
    - Consensus on Tartessian being Celtic?
    - Paucity of clear reliable evidence from Phoenician/Punic;

  - Timeframe of transmission of "Milesian" Q-Celtic to Isles? Possibly before Tartessian inscriptions?
  - Likelihood of Q-Celtic in Britain as well as in Ireland?
  - Need to bear in mind possible *typological* explanations for "non-Indo-European" traits in Insular Celtic (cf. above).
- So, sit on *several* fences:
  - Insular Celtic "non-Indo-European" features due to substratum or typology? What diagnostic?
  - If substratum, pre-Celtic inhabitants of Isles, or Phoenician > Tartessian?
  - Tartessian: Celtic or not?
  - Tartessian the source of the "Milesian" language bringing Q-Celtic to the Isles?
  - "Milesian" language to both Ireland and Britain, and P-Celtic from Gaul only later? Far-fetched!
- Teleological fallacy: one should ideally avoid positing conclusions before investigating the available evidence;
- But difficult to avoid when attempting to imagine plausible scenarios on the cusp between prehistoric and palaeohistoric linguistics.

Tibetan for "dog", pronounced /ˉkʰi/, cf. Welsh *ci*, Breton *ki*, Irish *cú*.

The theories of the 'Great Caravan Route' between Cilicia and Troy: the Early Bronze Age III period in inland western Anatolia

Turan Efe

Istanbul University

Abstract

At the beginning of the second settlement a change that we can define as a 'breaking point' takes place in Trojan indigenous cultural development. Behind this change must lie, to a great extent, the intensification of Troy's cultural and economic relations with the interior of Anatolia and beyond (north Syria and Mesopotamia). This change is archaeologically most evident in the pottery; the potter's wheel is introduced to Troy IIb along with new forms and wares. For a long time it has been widely accepted that the wheel – in use in north Syria and Cilicia since the Late Chalcolithic period – became known in the interior of western Anatolia only after its appearance at Troy, and there has been a general consensus that the potter's wheel and other Mesopotamian influences reached Troy through maritime trade from Cilicia westward and northward along the Anatolian coastline. The author, on the other hand, as early as the mid 1980s, had begun to defend the thesis that Trojan-Cilician relations were established over inland western Anatolia, rather than by sea. Here again he deals with the subject, now strengthened by new evidence that continues to come to light from recent investigations and excavations within western Anatolia – most especially that from Küllüoba, where excavation has been continuing under the author's auspices since 1996. The author now goes one step further to define this overland route between Cilicia and the north Aegean as the 'Great Caravan Route'.

Özet

II.Yerleşmenin başlarında, Troya'nın yerel kültürel gelişiminde 'kırılma noktası' olarak nitelendirebileceğimiz bir değişim gerçekleşir. Bu değişimin gerisinde, esas itibariyle Troya'nın ilk defa yoğun bir şekilde Anadolu içleri ve gerisindeki bölgelerle (Kuzey Suriye ve Mezopotamya) kültürel ve ticari ilişkiler kurması yatmış olmalıdır. Bu değişiklik özellikle çanak çömlekte izlenir ve buna paralel olarak Troya'da (IIb katı) çömlekçi çarkı da ilk defa kullanılmaya başlanır. Çarkın iç Batı ve Orta Anadolu'da Troya'dakinden daha sonra ortaya çıktığı kabul edildiğinden; Kilikya bölgesinde ve Kuzey Suriye'de Geç Kalkolitik'ten beri kullanıldığının bilinmesinden dolayı, Mezopotamya etkilerinin Kilikya üzerinden Akdeniz ve Ege sahilleri boyunca, Troya'ya ulaşmış olabileceği fikri hemen hemen herkes tarafından kabul görmekteydi. Yazar ise 1980'li yılların ortalarında, söz konusu ilişkilerin, deniz yolundan ziyade, iç Batı Anadolu üzerinden kurulmuş olabileceği tezini ortaya atmış ve bunu günümüze kadar da savunagelmiştir. İşte Yazar, son senelerde Batı Anadolu'da yapılan kazı ve araştırmalar ve özellikle kendisinin başkanlığında 1996 yılından beri kazılmakta olan Küllüoba kazıları sonucunda ele edilen bazı yeni somut verilerle, konuyu burada tekrar ele almaktadır ve bir adım daha ileri giderek, Troya-Kilikya ilişkilerinin gerçekleştiğini düşündüğü bu kara ulaşım yolunu 'Büyük Kervan Yolu' olarak tanımlamaktadır.

Since Hetty Goldman began publishing the results of her excavations at Tarsus (Goldman 1956), the Troy-Tarsus relationship in the Early Bronze Age (EB) III has continued to be one of the most hotly debated topics of the Anatolian Early Bronze Age. At that time, the striking similarities between the EB III pottery of these two geographically distant sites was puzzling, because parallels to these assemblages were practically unknown in inland western Anatolia. This was further complicated by various scholars regarding the distinctively local pottery of the Demircihüyük EB II phases as contemporary with that of the Trojan EB III (settlements II–IV),

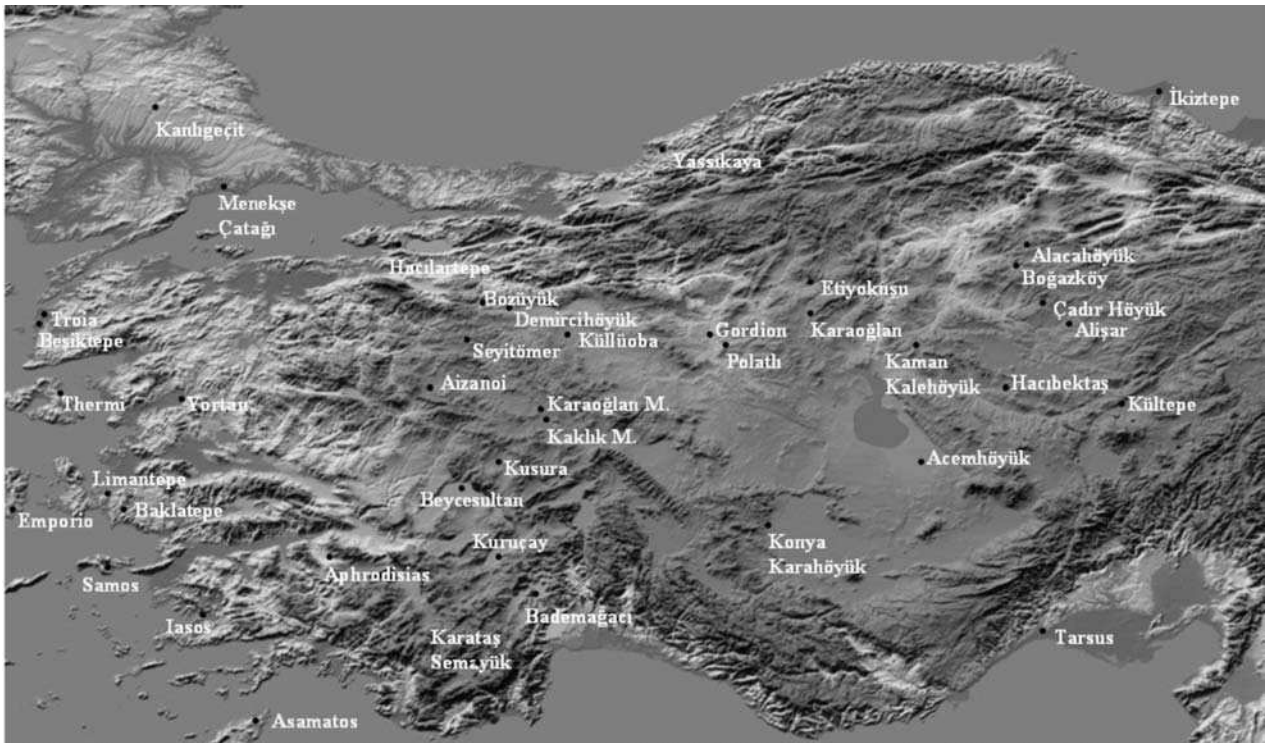

Fig. 1. Major Early Bronze Age sites in western Anatolia

thus ruling out the possibility that the new repertoires had earlier spread overland through the Eskişehir and İznik/İnegöl plains. That is, this equation mistakenly synchronised the late EB II horizon of Demircihüyük with the Trojan EB III period. This led scholars to an almost unanimous conclusion that relations between Troy and Tarsus had been established via a maritime route along the southern and western shorelines of the Anatolian peninsula. One of the strongest proponents of this theory was the late Machteld Mellink (Mellink 1986; 1993).

Excavations carried out along the Aegean coastline and on the Cyclades have contributed little to the validity of this suggestion. James Mellaart looked for clues inland. Following the Beycesultan excavations and his surface surveys in inland western Anatolia and on the Konya plain, he introduced the theory of a 'Luwian Invasion' (Mellaart 1958: 11; 1963: 210; 1965: 46–47). This theory was principally based upon the evidence of burnt layers at many sites in western Anatolia corresponding to the horizons of Troy IIg and the end level of the Tarsus EB II settlement.

In researching my dissertation on the Early Bronze Age (EBA) pottery of the later phases at Demircihüyük (completed in 1984 and published in 1988 in the Demircihüyük series), I studied and took into account the EB III elements of the poorly stratified and stray materials from the nearby sites of Bozüyük and Aharköy (Efe 1988: 80–88). This enabled me to correlate the final phases (phases P–Q) of the Demircihüyük EB II period with Trojan strata predating the Trojan second settlement, thus concluding that the typical western Anatolian EB III assemblage might be much better represented in the region than anticipated. Consequently, I propounded the existence of an important overland trade route between Cilicia and the Troad – with influences travelling in both directions – from the mid third millennium onward, suggesting, moreover, that much of the new pottery repertoire characterising the west Anatolian EB III period had most probably evolved in inland western Anatolia and spread outward from this region in opposite directions (Efe 1988: 93–99). An important criterion here was the evidence of early wheel-made forms along this route indicating influence from Cilicia into inland western Anatolia. This was the topic of my paper at the Thirty-fourth International Assyriology Congress in Istanbul in 1987 (Efe 1998). I cannot claim, however, that my theories were accepted with open arms; indeed some scholars continued to assess the Demircihüyük EB II material as belonging to the early EB III – in some instances dating it nearly to the end of the third millennium BC.

In the 1980s the excavations at the cemeteries of Bozüyük-Küçükhöyük and Demircihüyük-Sarıket produced new evidence in support of an overland trade route (Gürkan, Seeher 1991; Seeher 2000), as have the more recent Seyitömer salvage excavations (Efe, İlaslı 1997) and my own excavations, begun in 1996, at Küllüoba near Seyitgazi (Efe, Ay-Efe 2001; Efe, Türkteki 2005). These sites are shown on fig. 1.

We now have incontrovertible evidence for intense overland trade between Cilicia and the northern Aegean in the second half of the third millennium. Based on the results of an eight-year surface survey in the provinces of Eskişehir, Kütahya and Bilecik, I chose to excavate the large mound of Küllüoba; it appeared the site most likely to fill several gaps in the prehistoric sequence of the Eskişehir area – most particularly those within the Early Bronze Age. Needless to say, I hoped the excavations would reveal more concrete evidence for the above-mentioned theory. After ten years of excavating at Küllüoba, I remain more convinced than ever of the existence of such a trade route and I have gone so far as to refer to it as the 'Great Caravan Route' (Efe 2003a).

The following is a summary of my assessment of inland connections in light of the most recent research.

Early hints of Syro-Cilician influence on metal-working in inland western Anatolia

During the late EB II of inland western Anatolia, an obvious influx of Oriental elements can be felt – first in metalworking (fig. 2). We find an abundance of toggle-pins and lead bottles, as well as a spearhead with a bent tang and a crescent axe of Syro-Cilician origin in the EBA cemeteries of the Eskişehir region (Efe 2002: 54–61, figs 5:1–5, 9–12; Seeher 2000: figs 17.G.21.b, 23.G.100.f, 23.G.105.b, 25.G.141.b, 33.G.243.g, 37.G.305.h; Gürkan, Seeher 1991: fig. 21.8). Toggle-pins make an early appearance at Demircihüyük and Küllüoba in northern inland Anatolia (fig. 1) as well as in the cemeteries of Kaklık Mevkii, Harmanören and Karataş-Semayük further south (fig. 2; see also Efe, Fidan 2006: 21–26, Tab. 4, pl. 7). Similar metal finds have not yet appeared elsewhere in western Anatolia or the Aegean world in contexts so early. The late EB II is also the period in which the first use of tin-bronzes is attested in inland western Anatolia. Analysis of the metal artefacts from Demircihüyük-Sarıket, for example, revealed many objects of tin-bronze (Pernicka 2000). Indeed, the use of tin as an alloy might well have been one of the factors that opened up this inland trade route stretching from Cilicia to the northern Aegean (Troy and Poliochni) in the west.

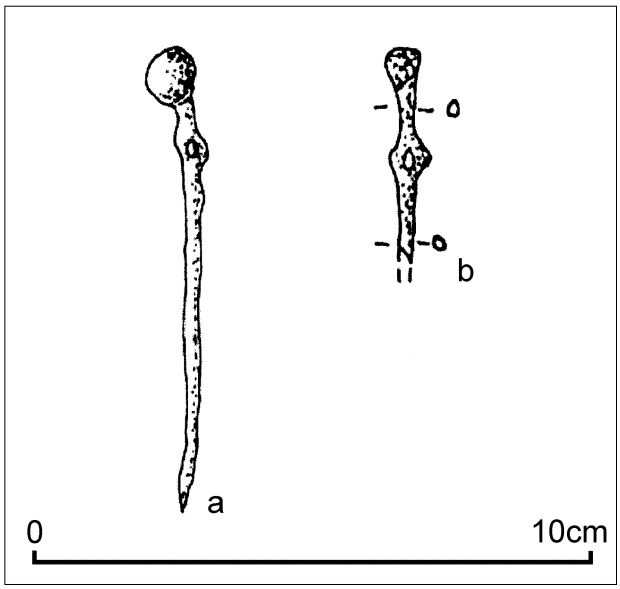

Fig. 2. Metal implements dating to the second half of the EB II period of possible Syro-Cilician influence found at Küllüoba

Parallel to this development, there are traces of the initial steps towards urbanism in western Anatolia. This is reflected in the development of upper and lower towns, as well as in buildings with possible administrative functions within settlements. Might this development not foreshadow the gradual emergence of large organised settlements under a central authority?

The late EB II period at Küllüoba and Seyitömer Höyük

Let us turn to Küllüoba, an inland western Anatolian settlement offering valuable hints of change in the socio-political structure as early as the initial stages of eastern influence during the EB II period (fig. 3).

The EB II settlement encompasses both an upper and lower town (fig. 4). The fortification wall surrounding the acropolis town dates to the very beginning of the EB II period; two main phases are now evident. The upper settlement represents a linear plan centred around two large free-standing complexes – complexes I and II – which were very likely administrative in function. The gate/court/palace layout in the east of the acropolis as well as the plan of complex I itself (a central megaron longitudinally flanked by two or three subsidiary structures) is, as far as we know, the earliest and simplest example yet identified in western Anatolia and the Aegean realm. It now appears that complex I and the structures surrounding the court on the other three sides may have formed one large entity. This is suggested by the absence of an oven in the complex itself, and the existence of at least two kitchens (each with an oven and a hearth) to the north of the east gate, as well as what seems to be storage bins limiting the court on the north and east.

A second large complex now completely excavated on the west of the acropolis (complex II) displays at least three phases and includes, on its southern flank, a megaron some 31m long with a 2m wide entrance in its final phase, approached by a stone ramp. Two earlier ramps lie beneath. Within this western complex there were also facilities for storage, including one corridor-like storeroom with a row of pithoi *in situ* (figs 4–6).

This complex remained in use over a long period, as is attested by the various phases of building and reconstruction. We have assembled quite a lot of information about the various functions of the different units. The complex definitely included three megara, all facing west. The great megaron in the south had only two rooms in its early phases and a third room was eventually annexed at the back. The great megaron exhibited practically no internal architectural elements save for the hearths. Nor did we encounter *in situ* finds indicative of everyday use. This provides a stark contrast with the situation in the units annexed to it, which included storage bins, pantries and ovens, as well as much pottery and many implements of ground stone, chipped stone and bone. This would suggest that the great megaron had a religious or an administrative function, whereas the annexes reflect a more domestic character.

As regards the lower city, we have established that the EB I and II settlement spread over a wide area (ca 300m by 150m) covering the entire surface of the mound around the acropolis. It seems that the configuration of upper and lower cities may very well have begun as early as the end of the EB I period, clearly continuing to develop in the succeeding EB II period.

The results of work in grids AI/AJ 23/24 and AR 22 (fig. 3) would indicate that at least part of the lower city comprised insulae and perhaps also free-standing houses (fig. 4). The unit apparently including a megaron-house

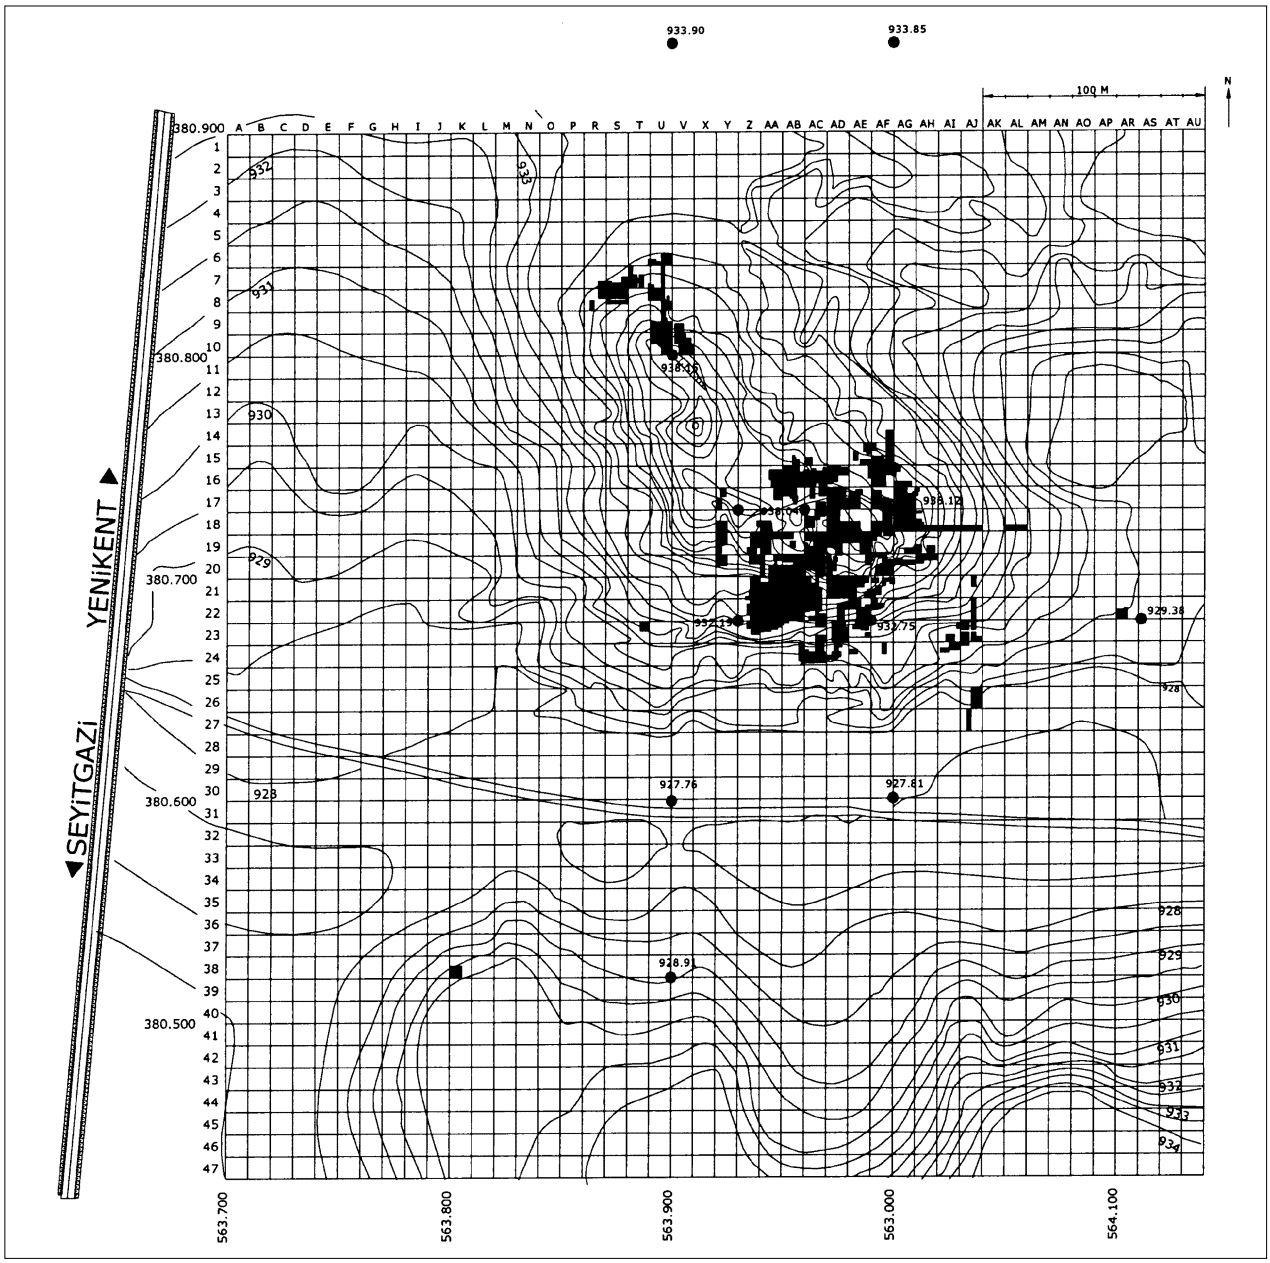

Fig. 3. Topographical plan of Küllüoba showing the excavated areas (2006)

Fig. 4. Plan of the upper town and the houses in the lower town as exposed

in grids AI/AJ 23/24 and attests that such a plan was present here at least from the early EB II onward. The megara in the more highly configured plans of complexes I and II on the acropolis may have developed from this plan. Consequently there is a possibility that the houses in the late EBA settlements in the north Aegean islands (often including a megaron) had their roots in mainland Anatolia.

At Seyitömer, 30km north of Kütahya, excavation of one burnt room dating to the very end of the EB II revealed a pottery kiln and many complete vessels, some of which were recovered in the process of manufacture. Pottery moulds fashioned from clay were also found here (Efe, İlaslı 1997). As evident both in the burnt level at Seyitömer (figs 7a–b, 8, 9a–b, 10a) and in the contemporary phase IVA at Küllüoba (figs 7c–e, 9c, 10b), the first signs of a distinct change in the pottery repertoire emerge in the Eskişehir area. This phase marks the first tendency towards homogeneity in the ceramics throughout the whole of western Anatolia.

Marked elements include red slipped wares foreshadowing Carl Blegen's Red Coated Ware at Troy, as well as the earliest tankards, tripod cooking pots and beak-spouted jugs with backward-leaning necks yet discovered in inland western Anatolia. A few of the small red slipped plates of Trojan A1 type might have been thrown on the wheel.

Some vessel shapes and ornaments from the Seyitömer burnt level which find counterparts both in the Eskişehir region and in the Trojan second settlement are

shown in figs 8–10. Similarity in ornament – a combination of impression and incision – between one of the Troy lids (see Blegen, et al. 1950: 404, pls 36.1149, 35.437, 35.770, 35.553, 36.860) and one from Seyitömer (fig. 10a) was noted.

The horizon represented by the Seyitömer burnt level and Küllüoba phase IVA reflects the first intensive cultural and trade relations with the Troad and the northern Aegean. This phenomenon must have introduced the cultural innovations seen at the beginning of the Trojan second settlement. Indeed, we might speak of this as a phase transitional into EB III (the topic of the Trojan/inland northwestern Anatolian connections during the Trojan II settlement is discussed in detail in several other publications: Efe 1988: 93, 114; 1998: 297; 2002: 54; Efe, İlaslı 1997: 596).

The EB III period

This development continues uninterrupted with more dramatic changes marking the beginning of the Anatolian EB III period (around the mid third millennium). Among the many cultural innovations on the Anatolian peninsula were the emergence of more developed urban centres such as the Trojan second settlement and Liman Tepe, the first use of the potter's wheel west of Cilicia, new ceramic wares and forms, and new technologies and typology in metalworking. Then, towards the end of the Trojan second settlement, this development is felt in the Aegean world as well, where it is known as the 'Anatolianising' trend, characterised by the repertoire of the so-called 'Lefkandi I' or 'Kastri Group'. The emergence and the scope of Oriental influence in western Anatolia and the Aegean in the second half of the third millennium have very recently been discussed by L. Rahmstorf (Rahmstorf 2006).

That the potter's wheel, introduced most probably from Cilicia, brought new forms with it is clearly demonstrated at Küllüoba. Most of the early wheel-thrown pottery is represented by plain ware. In the first phase of the EB III at Küllüoba, this ware represents 12% of the ceramics (phase III D) when it was introduced, a proportion that rises to ca 20% in the following phase (phase III C).

The typical west Anatolian *koine* first appears dominant in Cilicia following a severe conflagration at the end of the Tarsus EB II period (Mellink 1989: 324). The megaroid row-houses laterally aligned in the Tarsus EB III settlements resemble those already established in the Küllüoba EB II period. The new pottery repertoire at Tarsus is stylistically more closely related to that of inland Anatolia than to that of the Aegean coastline. The effect of this apparently eastward-moving influence can be felt as far east as the Gedikli cemetery in the İslahiye area and even at Titriş on the banks of the Euphrates; in this region we find the depas, the tankard and flasks with cutaway spouts, as well as marble idols (Gedikli: Alkım 1979: figs 28–31; Titriş: Algaze, et al. 1995: fig. 35; Laneri 2002: fig. 8; for the distribution of the depas amphikypellon east of Cilicia, see Rahmstorf 2006: fig. 3).

Fig. 8. Pots with horizontal lug handles from Seyitömer (Efe, İlaslı 1997: pl. I)

The most characteristic vessel forms common to the Troad and the Eskişehir region in the early EB III period are Trojan A2 platters (compare fig. 11a with Korfmann 2001: pl. 374), small jar-like 'amphorae' (compare fig. 11b with Blegen, et al. 1950: pl. 389: 36.863, 37.997) and necked pots with horizontal or vertical lug handles on the bodies (figs 8, 9, see also Blegen, et al. 1950: pl. 398: 36757, 35578). These necked vessels of plain ware are distinguished by taller, more elongated bodies made possible by the use of the potter's wheel – a phenomenon evident at Tarsus and Troy as well as at Küllüoba (fig. 11b). Such characteristic forms, however, do not seem to appear this early along the southern Aegean coastline. The necked pot with pierced vertical lugs on the shoulder – from the middle phases of the EB III at Küllüoba (not illustrated) – finds nearly exact parallels at Troy, especially in the second settlement (Blegen, et al. 1950: pl. 403: 36.732, 35.427, 37.1113).

The earliest examples of depas at Küllüoba (for example, fig. 12a–b) display pointed bases and would appear to be all hand-made; although eventually wheel-made depa occur as well (fig. 12c). This striking form represents 7% of the early EB III pottery inventory at Küllüoba and thus appears to have been much more frequent here than at sites both to the west and to the east along the proposed trade route.

As at Tarsus (and Troy, for that matter) depas eventually become shorter and more squat. Fig. 12d shows a Küllüoba depa from phases with transitional *(Übergangsperiode)* pottery, which compares with examples from Tarsus (Mellink 1989: pl. 63:4–5). The walls may be curved or straight and flaring.

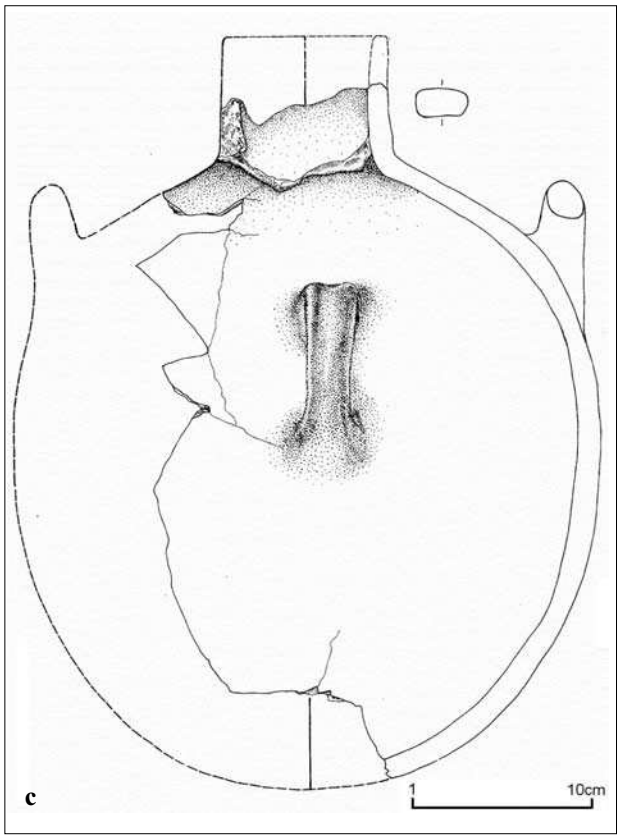

Fig. 9. A comparison of certain vessel forms from Seyitömer and Küllüoba. (a, b) Seyitömer (Efe, İlaslı 1997: pl. I); (c) Küllüoba

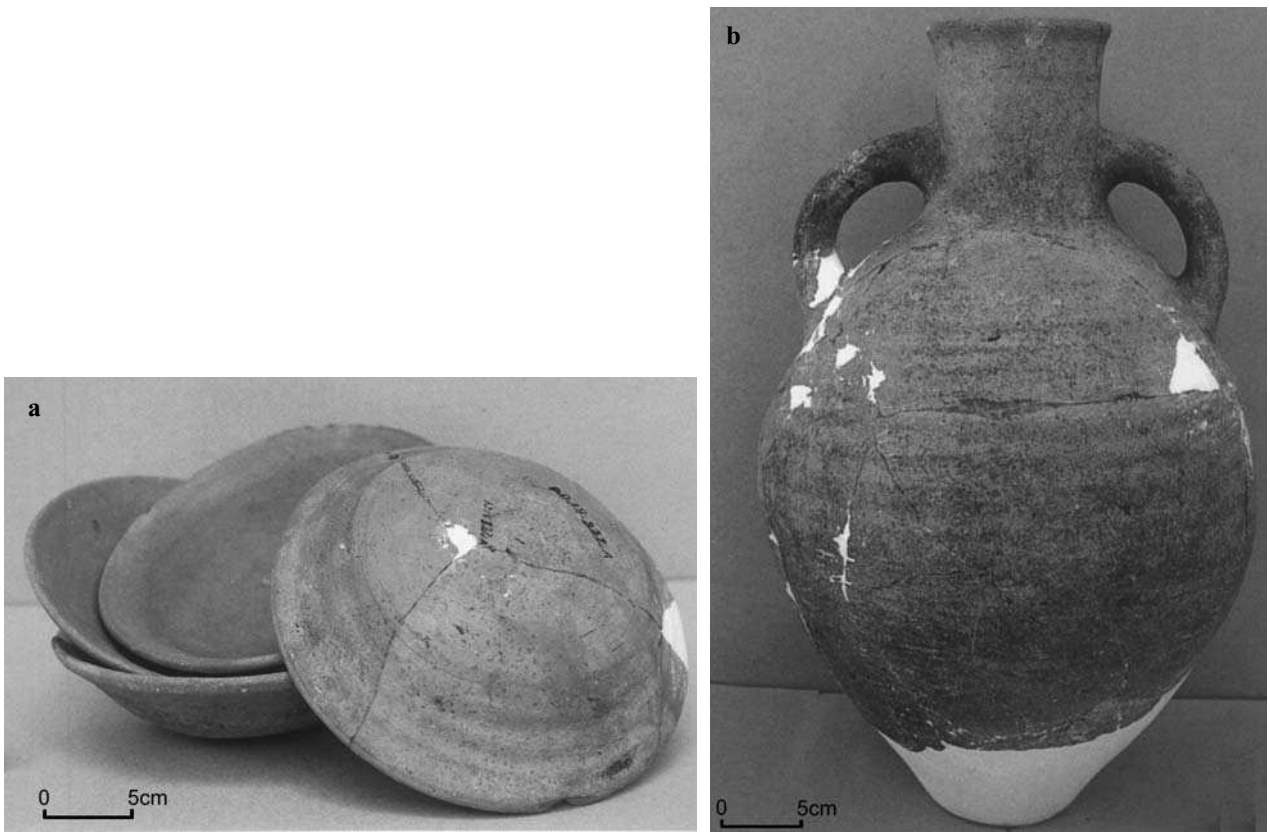

Fig. 11. Plates and amphora from Küllüoba of the early EB III period

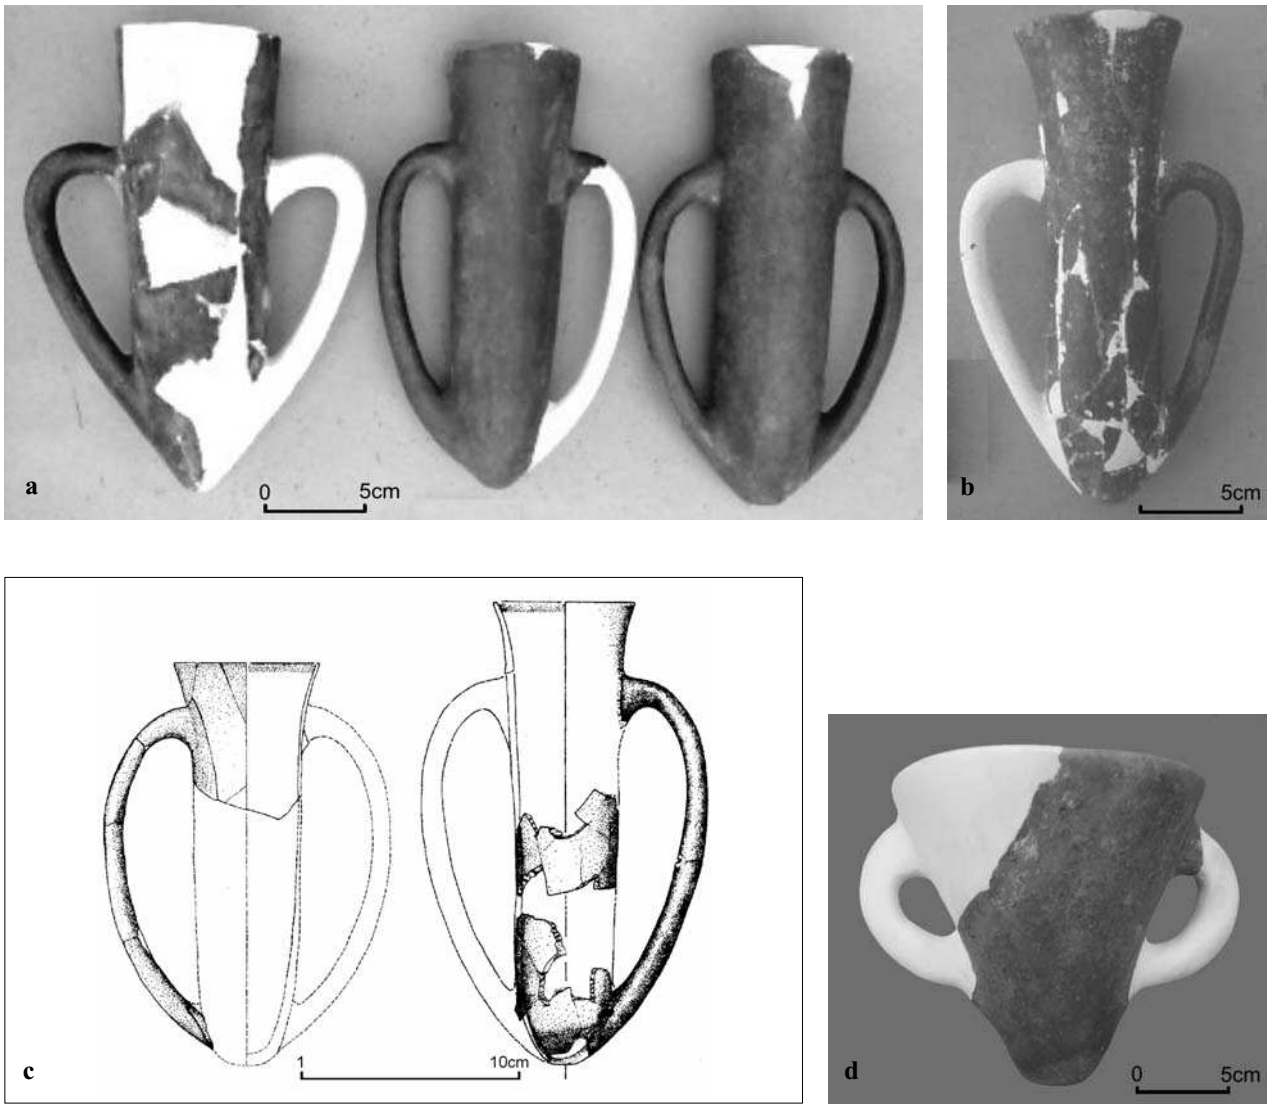

Fig. 12. Depa from Küllüoba

Westward from Cilicia, imitation Syrian bottles also come from the middle phases of EB III at both Küllüoba and Troy (fig. 13). This kind of bottle is also found at Palamari on Skyros in the north Aegean (for a distribution map of Syrian bottles, see Rahmstorf 2006: fig. 5). There are striking similarities between the EB III bone and marble idols of Troy and those of Küllüoba (compare Blegen, et al. 1950: pl. 360:35-60, 36-297, 36-84; Schliemann 1881: no. 996-997 with fig. 14).

One particular artefact that suggests direct trade between Syro-Cilicia and inland western Anatolia is the foot- or boot-shaped stamp seal. Examples from Tarsus, Konya/Karahöyük and Küllüoba come more or less from the same horizon, in other words, the mid third millennium (compare fig. 15a with Alp 1972: fig. 20:16, pl. 15:35; Goldman 1956: fig. 394:44). Stamp seals of metal also appear at Küllüoba (fig. 15b). From this same horizon at Küllüoba comes a skilfully executed long and slender bone implement with three perforations at equal intervals along the length (fig. 16). This might have been used as a balance beam in a scale for weighing valuable materials such as precious metals. Nearly exact parallels to this find come from late Troy I and the Red period at Poliochni (see Blegen, et al. 1950: pl. 222:37-548, fig. 16b–c; Bernabò-Brea 1964: pl. 178, 9). Another possible fragmentary example comes from Bozüyük (Koerte 1899: pl. 4:10; Rahmstorf 2006: fig. 10:26).

Fig. 17b shows the known concentration of early EB III wheel-made plain ware, in which the Trojan A2 plates appear most frequently. The plains of Konya and Akşehir, the Afyon region and the upper Sakarya plains, and finally the plains of Eskişehir and İznik/İnegöl, one after another, reflect an early concentration of this ware, suggesting the geography across which the 'caravan route' between Syro-Cilicia and the Troad probably

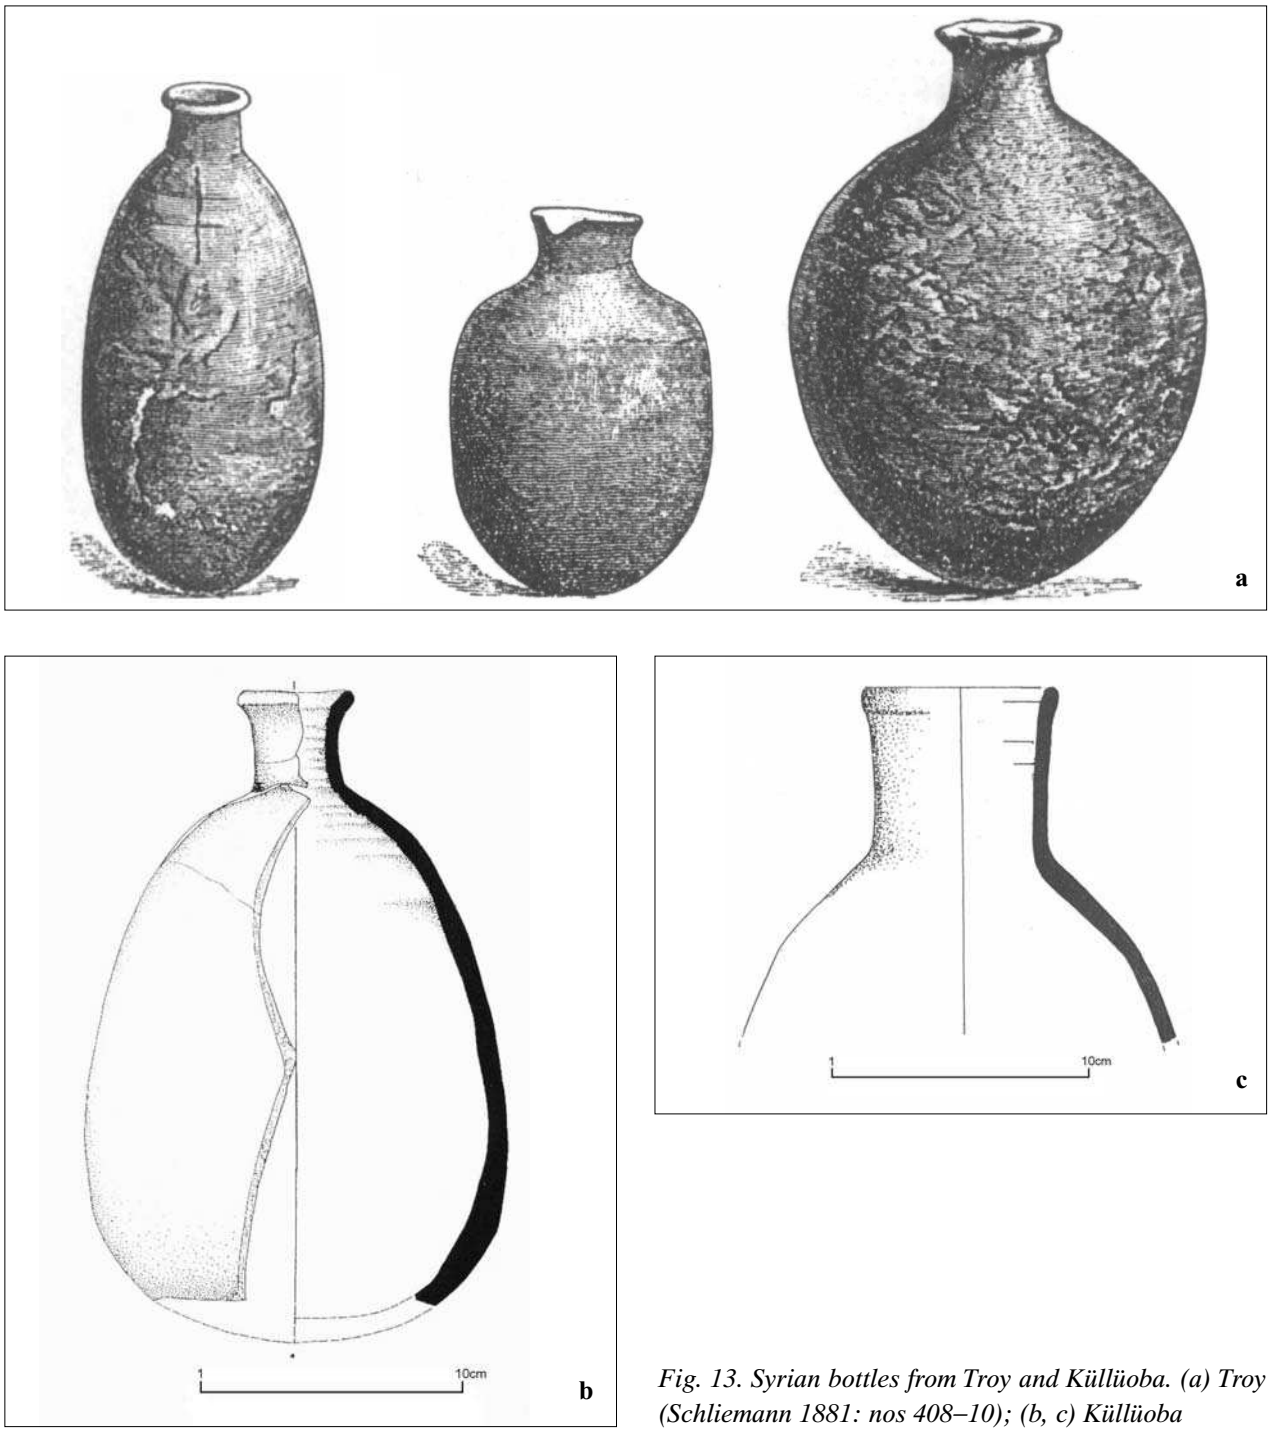

Fig. 13. Syrian bottles from Troy and Küllüoba. (a) Troy (Schliemann 1881: nos 408–10); (b, c) Küllüoba

emerged. Influence from this caravan route eventually found its way through inter-connecting valleys and plains both to the Aegean coastline and to central Anatolia. A ware related to this plain ware – most probably a later version – has shown up at Mehmet Özdoğan's excavations at Kanlıgeçit near Kırklareli in Turkish Thrace, accompanied by certain other west Anatolian features (personal communication), not only in ceramics but in architecture as well (Özdoğan 1998). Similar pottery has also been discovered at sites further north in Bulgaria.

In addition to the above-mentioned common finds along this proposed caravan route and in the adjunct surroundings, we see the emergence of new techniques in metalworking appearing in Mesopotamia and Troy. The toggle-pin demonstrates new forms during the EB III phases at Küllüoba, allowing us to trace its chronological development at the site (Efe, Fidan 2006: Tab. 4).

A stone trinket mould found in the late EB III phases at Küllüoba (ca 2200 BC according to C14 dating) may be taken as proof of the continuation of Syrian connec-

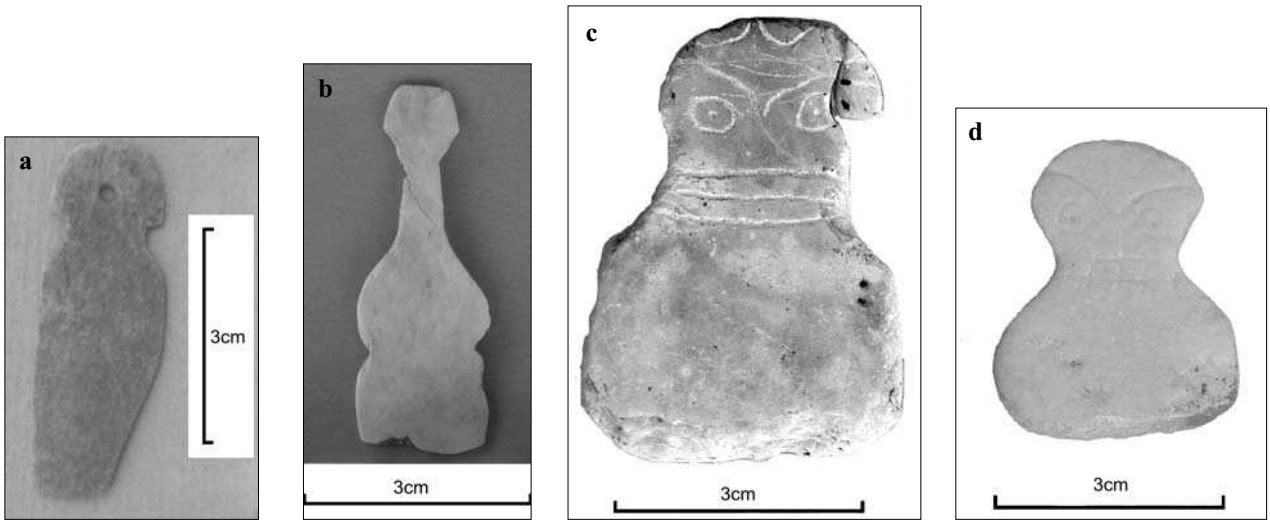

Fig. 14. Bone (a, b) and marble (c, d) idols from Küllüoba

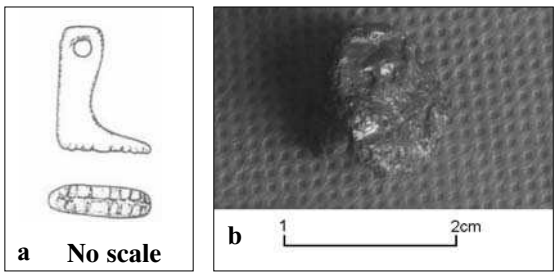

Fig. 15. Stamp seals from Küllüoba

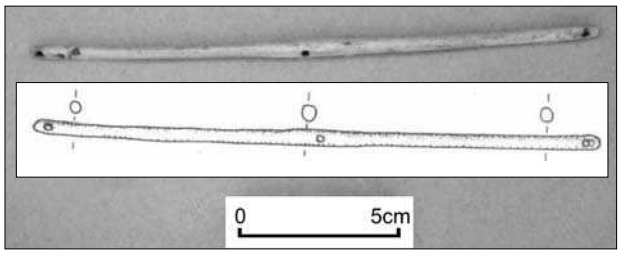

Fig. 16. Possible scale beam from Küllüoba

tions (Efe 2006: figs 1–5). A similar trinket mould from Titriş Hoyük, north of Urfa on the Euphrates, is approximately contemporary (Laneri 2002: figs 11, 12). A lead figurine very similar to those that would have been cast in this mould was found in Heinrich Schliemann's excavations at Troy (Schliemann 1881: 337, no. 226). Jeany Canby is of the opinion that these moulds might have been carried by metal-smiths travelling along the caravan routes between Mesopotamia and western Anatolian sites (Canby 1965: 52–54; 2003: 172; Efe 2006: 301, 303).

Towards the end of the EB III, however, inland western Anatolia appears to have bonded culturally, as well as politically, with central Anatolia, while sites along the entire Aegean coastline, on the other hand, became much more a part of the Aegean realm. Maritime commerce between the Aegean realm and the eastern Mediterranean coastal centres along the southern shores of Anatolia took on increased significance. It is most likely that developments in shipping and navigation, as well as new political alliances, paved the way for the new trade network of the Assyrian Colony period.

Conclusions

We can almost certainly say that the underlying factor of the important changes toward the middle of the third millennium, which mark the beginning of a new phase in the cultural development in western Anatolia called the EB III period, is the impact of intensive trade with the Mesopotamian cultural sphere. This commerce resulted in culturally and politically active centres, the emergence of an élite class, ceremonies and feasts, new habits in eating and drinking, and a trend towards more division of labour, standardisation and mass production. In western Anatolia, its early influence on the material culture can be traced most pronouncedly along this overland trade route from Cilicia to the north Aegean. Eastward of the Sivrihisar range in central Anatolia and westward along the southern Aegean coastline, this early impact is slight – if at all in evidence. The early distribution of wheel-made plain ware diagonally crossing the Anatolian peninsula (fig. 17b) is one of the most important clues to the 'Great Caravan Route' between Cilicia and the Troad (fig. 17a) and, consequently, to the origin of the west Anatolian EB III cultural elements. It is hardly a coincidence that the geographical distribution of the early

toggle-pins and tin-bronzes (Pernicka 2001: fig. 409) follows the same diagonal crossing. The chronological relationship between the two main waves of Oriental influence on western Anatolia is shown in fig. 18.

The Aegean world had its own trade network encompassing mainly the western coastline of Anatolia, the Aegean islands and mainland Greece. Following the Trojan first settlement, however, north Aegean settlements like Troy and Poliochni received inland influences via the 'Great Caravan Route', despite close ties with the rest of the Aegean. Eventually inland Anatolian EB III cultural elements (characterised by the so-called 'Lefkandi I' or 'Kastri Group') reached the other Aegean islands as well. This occurred toward the end of the Trojan second settlement, and appeared as an isolated phenomenon by no means comparable to the influence in the northern Aegean. Cyprian Broodbank is among those of us sceptical of direct sea trade between

Horizon of the 'Great Caravan Route' of the EB III period

Horizon of the early influx of Oriental metal types into inland northwest Anatolia

Fig. 18. A chronological chart synchronising the stratigraphies of major EBA sites in western Anatolia

the Levant and the Aegean islands much before the end of the third millennium BC and the early second millennium BC (Broodbank 2000: 44, 283). The suggestion of main overland trade routes connecting the Syro-Mesopotamian and the Aegean worlds in the EB III period has recently been finding more and more acceptance (Schachner, Schachner 1995: 310–14; Genz 2003; Rahmstorf 2006).

To evaluate and assess the mechanism, development and dimension of EBA trade and provide further evidence for the 'Great Caravan Route', we need to excavate more of the large mounds possibly representing trade centres along the proposed route – most particularly those in the Konya plain and in the region of inland western Anatolia stretching from the Lake District in the south to the plains of İznik/İnegöl in the north.

Introduction

The theories of archaeology are in tatters.

Once the Great Sphinx was proven to be thousands of years older than dynastic Egypt by **Robert Schoch** and **John Anthony West** in 1993, and Gobekli Tepe was dated at 9500 BCE in 1994, the foundations for the entire conventional chronology came unhinged. With the onslaught of books over the last 50 years revealing enormous piles of evidence from every corner of the globe that modern archaeology has deliberately ignored, the credibility of the prevailing dogma began to rapidly erode.

With the revelations of a cometary impact in 10,900 BCE now solving the mystery of the termination of the Pleistocene era ice age, with its massive tsunami accounting for the destruction of the ice age megafauna, the false façade of Uniformitarianism has been permanently shattered. The **diffusionist** and **catastrophist** theories are on the ascendant and the spurious accusations of racism against diffusionists will shortly be seen as the dismal red herrings that they are.

This book shall serve as one more blow against the crumbling edifice that passes for archaeological theory today. In years to come, people will look back and marvel at the inanity of the mainstream theories that are now on their way to the dust heap of history, and at the tenacity with which their proponents clung to them in the face of overwhelming evidence.

And a new generation will grow up, and it will believe the opposite of what the old generation believed, and perhaps wiser decisions will be made because of it.

The Akkadian Dynasty

Sargon the Great	**His giant son Menes**	**His giant son Narmar**

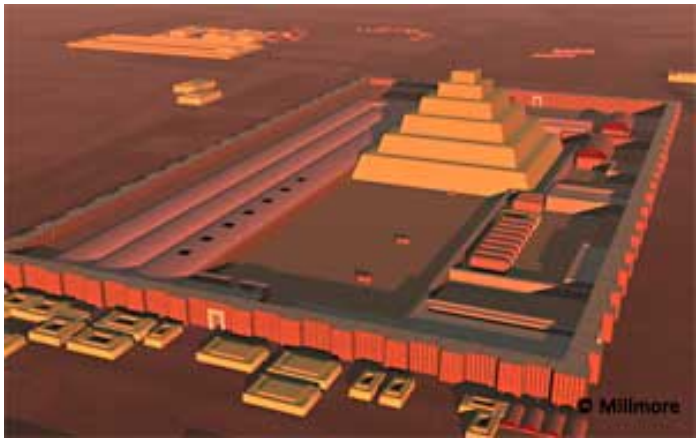
A model of the Thor Heyerdahl's Tigris near the Pyramid of Guimar on Tenerife, Canary Islands.
The author visited Guimar and saw the museum display of Heyerdahl's cogent theories in 2005, which eventually led to this book.

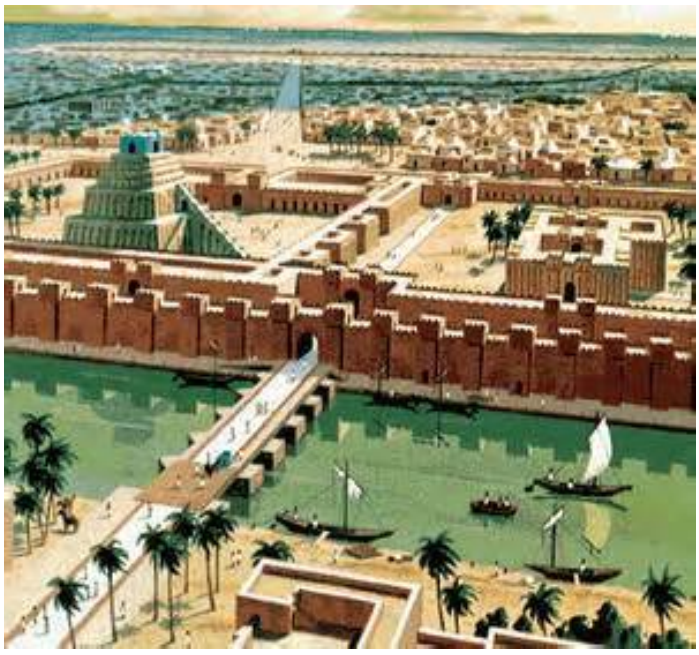
1. W.M. Flinders Petrie and the Dynastic Race Theory

In the early 20th century, Egyptologist Sir W.M. Flinders Petrie deduced that skeletal remains found at pre-dynastic sites at **Naqada** in Upper Egypt indicated the presence of **two different races**, with the **Followers of Horus** exhibiting a noticeably larger skeletal structure and cranial capacity. Petrie concluded that the physical differences of the remains in conjunction with the previously unknown burial styles, novel tomb architecture, and abundance of foreign artifacts inferred this race must have been **an invading elite** that was responsible for the sudden rise of Egyptian civilization. This began what has been called the **Dynastic Race Theory**. The Theory holds that the earliest roots of the Ancient Egyptian dynastic civilization were imported by invaders who then founded the First Dynasty and brought culture to the indigenous population.

Based on plentiful cultural evidence, such as architectural styles – most notably the distinctly Mesopotamian "niche-facade" architecture; pottery styles; cylinder seals and artworks, as well as numerous Predynastic rock and tomb paintings depicting Mesopotamian style boats, symbols, and figures, Petrie determined that **the invading race had come from Mesopotamia**, imposed themselves on the native Gerzean culture and became their rulers. Petrie argued that the Mesopotamians conquered both Upper and Lower Egypt and **founded the First Dynasty about 3100 BCE**. Predynastic and First Dynasty burial sites similar to Naqada were also found at Abydos, Saqqara, and Hierakonopolis.



Saqqara ziggurat and enclosure



Sumerian ziggurat and enclosure at Lagash

2. Modern Versions of the Theory

Following earlier proponents such as **L. A. Waddell**, and Walter Bryan Emery (a former Chair of Egyptology at University College London) modern scholars such as **David Rohl** and **Michael Rice** have advanced reasons in support of a Mesopotamian origin for the ancient Dynastic Egyptians.

According to Egyptologist David Rohl, "*There is little evidence of kingship and its rituals very much before the beginning of the 1st Dynasty; no signs of the gradual development of metal working, art, monumental architecture and writing – the defining criteria of early civilization. Much of what we know about the pharaohs and their complex culture seems to come into existence in a flash of inspiration.*" Rohl believes the most dramatic evidence to support this theory is the **sudden introduction of distinctly Sumerian "niche-facade" architecture found in several pre-dynastic sites including Abydos and Sakkara.** He says, "*It is highly improbable that such specialized building techniques were independently invented in two widely separated regions at the same historical period without cultural transmission.*"

Rohl believes, like Petrie, that the catalyst for this sudden development was the **influx of a Mesopotamian "foreign elite" who made their way to Egypt** by sailing around the coastline of the Arabian Peninsula into the Red Sea, then **dragging their boats across the desert to the Nile**. Rohl notes numerous **pre-dynastic rock carvings** found in several locations from Wadi Abbad to Abydos which depict large Mesopotamian style boats with crews of up to 75, which are being pulled across land.

The predynastic Egyptian god Min is associated with the eastern desert and two giant limestone statues of Min were found at Koptos. The dragging of ships across the desert is also depicted there, and it is clear that **Min is none other than Menes**.

Petroglyphs on the walls of the wadis up which the Shemsu Hor dragged the ships on rollers on their way to the Nile.

3. The Hamitic Hypothesis

Hamitic is a term for the peoples descended from Noah's son Ham (Hebrew Kham, Egyptian Khem). In the 19th century, the "**Hamitic race**" was designated a sub-group of the Caucasian race, grouping together the non-Semitic populations native to North Africa, the Horn of Africa and South Arabia, including the Ancient Egyptians.

Ham/Kham had four sons:

1. Cush (Kish), ancestor of the Akkadians
2. Mizraim, ancestor to the Egyptians, the Minoans and the Phillistines
3. Phut or Put or Pun, ancestor to the Libyans (Punic)
4. Canaan, ancestor to the Phoenicians, Canaanites, Hittites and Amorites

Old accounts state that Egypt was originally named **Khem** after Kham. After his son Menes rebelled against him, invaded Egypt and took over, the land became known as **Mizraim** in Hebrew, Misr in Egypt. Eusebius said that Mizraim was known to the Greeks as Aegypticus, from which we get the modern name of Egypt, but the Arabs still refer to it today as Masr.

Why are the ancient sources not believed?

Because their statements would overturn the shaky chronology invented to explain early Egyptian history. It is certainly not because there is solid evidence to the contrary:

Conventional Egyptology's shaky chronology

Dynasty 1	Date BCE	Tomb
King Scorpion ?	c. 3200 ?	?
Ka	c. 3150 ?	Abydos
Narmar	c. 3100 ?	Abydos
Hor-Aha, Aha-Men, Menes	c. 3050 ?	Abydos, Saqqara?

Their dating is obviously questionable.
They have even gotten the **order** of the rulers wrong. It should be **Ka, Menes, Narmar**.
King Scorpion is another name for Ka (Sargon/Shar Gin).

Is the conventional Sumerian chronology any more solid?

"*While Sumerian history is apparently older than Egypt, the earliest Sumerian dates around 2900 BC -- with no confidence until around 2700 -- appear to be later that those given for Egypt in the Archaic, beginning around 3100 BC. This effect is the result of* ***the fragmentary nature of Sumerian chronology…****. The "21 Kings since the Flood" of Kish would put us back* ***substantially before 2700, if not before 2900*** *-- if the numbers bear any relation to reality.....* ***What is unavoidable is that we have little evidence apart from legend*** *for Sumerian history, despite the archaeological indications that writing may have begun as early as* ***3400 BC****, while* ***in Egypt there are actual tombs for many of the I and II Dynasty Kings, at Saqqara, Abydos, or both****. Egypt, as a unified Kingdom, unlike the city states of Sumer, could be focusing its collective efforts on* ***its records and its monuments****, as* ***Sumer could not****, with the full resources of a large, organized state directed to preserving the past*." http://www.friesian.com/notes/oldking.htm#sumer

If anything, it is <u>less</u> reliable.

There are three competing Sumerian chronologies: Long, Middle and Short (0, 64 and 120 years apart). They do not agree, obviously. And they are not synced to Egyptian chronologies.

The Akkadian Dynasty Conventional dating				
Ruler – years	**Dates BCE**			**Comments**
	short	**medium**	**long**	
Sargon – 55/56	**2270 -** 2215	**2334 -** 2279	**2390 -** 2334	*"cupbearer of Ur-Zababa of Kish; he built Agade"*
Rimush – 9/15	2215 - 2206	2279 - 2270	2334 - 2319	*"the younger son of Sargon"*
Manis-Tusu – 15	2206 - 2191	2270 - 2255	2319 - 2304	*"the elder son of Sargon"*
Naram-Enzu – 35/37/56	2191 - 2156	2255 - 2218	2304 - 2248	*"the son of Manis-tusu"*
Shar Gani-Eri - 24/25/26	2156 - 2132	2218 - 2193	2248 - 2222	*"the son of Naram-Enzu"*

Early Bronze Age: New Chronology [Appendix 3]
Flood of Noah/Ziusudra: 3142 BCE

Beginning of Early Bronze Age 3132 BCE						
Rulers	**Start**	**Length**	**End**		**Hebrew**	**LXXa**
Akkadians	3132	205	2927		Noah, Shem, Ham	3142
Gutians	2926	124	2802		Heber	2876
Ur III	2801	115	2686			
Avan Elamites	2685	15	2670

End of Early Bronze Age 2040 BCE						

Utnapishtim / Ziusudra / Noah

4. The Shemsu Hor

The Egyptian legends say that it was **the Shemsu Hor, the Followers of Horus** who entered and took over the country of Egypt. Who were they?

> "*The name Horus is Greek. In ancient Egypt he was known as "Heru" or "Hor" or "Har", which is translated as "the distant one". He was considered to be a celestial falcon, and so his name could be a specific reference to the flight of the falcon, but could also be seen as a more general solar reference. It is thought that* ***the worship of Horus was brought into Egypt during the predynastic period.*** *The Turin Canon, describes* ***the predynastic rulers of Egypt*** *as* ***"the Followers of Horus"****. Some scholars argue that the mythical battle between Horus and Set was once* ***a real battle between the followers of Set and the followers of Horus.*** *If this was the case, it would seem that the followers of Horus won, as Horus remained a popular emblem of kingship while Set was transformed into a symbol of evil*." http://ancientegyptonline.co.uk/horus.html

David Rohl says:

> "The epithet ascribed to the ancient Mesopotamian flood hero [Ziusudra], 'the far distant', is the exact meaning of the Egyptian word 'Horus'.

Noah	**Horus**	**Ziusudra**

Rohl has explored the wadis of eastern Egypt, where petroglyphs depict the overland transport of Sumerian ships to the Nile, providing powerful confirmation that Waddell's thesis of the Sumerian impetus to Egyptian civilization, Petrie's **Hamitic Dynastic Theory**, is correct. Rohl has identified these invaders from the east as "***The Followers of Horus***".

> "…these invaders came from Mesopotamia at the onset of the third millennium BC: "We can tell this from their style of weapons, ship design, their dress and their religious symbolism. They carry pear-shaped maces … and their ships are typical Mesopotamian seagoing vessels. Their chieftains wear tall twin plumes, and kilts with animals' tails attached. I've linked them with the mythical '**followers of Horus**' because the carvings feature the falcon god, Horus".

In addition to the evidence available to Petrie et al., Rohl also points out similarities in the names of divinities and places in the religious beliefs of the two cultures, and in depictions of regalia.
For example, **the Primeval Mound** of the Egyptian first creation was called the **Island of Nun**, and was surrounded by the Waters of Nun, while the Sumerian name for the great temple in their first city of Eridu was **Nun.ki** – the 'Mighty Place' – and it was **built on an island** in the reed swamps. Several scholars have also noted that the name Osiris is a Greek pronunciation, and that **the god would have been called Asar in Egyptian, while the Sumerian god of the Eridu area was also called Asar.** In this case, a Greek translation has obscured an important clue.

5. L. A. Waddell

There is a little-known book written in 1930 by an erudite Englishman, L.A. Waddell. It is called "***Egyptian Civilization: Its Sumerian Origin and Real Chronology***". In it, he states that a powerful Sumerian kingdom colonized Egypt under Sargon the Great, his son Menes, and his grandson Narmar. They also colonized the Indus Valley, Crete and Phoenicia, and sent trading expeditions to Britain. Waddell could read Egyptian hieroglyphs, Sumerian cuneiform and Indus valley script, apparently. He shows that the Sumerian King Lists, the Egyptian King Lists and the Indian King Lists correspond, although **the kings bear different names in each place**. The key to decoding this information is the realization of the equivalence of the king's different names in different lands of their empire.

Menes (also **Aha-Men)** of Egypt was known as **Manis-Tusu** in Sumeria**, Minos** in Crete and **Manasyu (**also **Asa-Manja)** in the Indus Valley.

Menes' son reigned as **Narmar** in Egypt**, Naram-Enzu (Naram, the Wild Bull Lord)** in Sumeria, **Mino-Taur (**son of **King Minos)** in Crete**,** and **Karam-Ba** or **Neram** in the Indus Valley. Narmar's palette in Egypt shows him as the Wild Bull, trampling his enemies in battle (bottom right).

The Narmer Pallette

L.A. Waddell

Waddell shows that **Egyptian hieroglyphs are derived from Sumerian cuneiform**; and points out that the Saqqara funerary enclosure buildings are built in the **Sumerian style**, just as Petrie had said.

Waddell uses his translations of **the Indus Valley seals** to acquire the names of the kings. He equates the images on the seals with Sumerian cuneiform, and gives page after page of the symbols side by side, with the meaning. From the Indus Valley seals:

The Seal of Sargon the Great, father of Menes:

SAG / AZU / KAD TUB / UMUN / ASH GUT

Sag / the Seer / the Mighty Ruler / the Overlord / the Goth

The Seal of Sargon's Queen Lady Ash-Nini at her Abydos tomb

PARIN / BARA / KAD / MA / ASH-NINI

(Of) The House of / the Pharaoh / the Ruler / My Lady/ Ash-Nini

The Seal of Menes, conqueror of Egypt:

UMUN / MAN / A-HA / MAR / SHA-GANI / BARA / GU-EDIN-AS

The Overlord / Man / Aha/ the son of / Sargon / the Pharaoh / in Indus Land

Menes self-description:

UMUN / A-HA / MAR / GUT / GIN-GE / GU-EDIN-AS

The Overlord / Aha / the son of / the Goth / Sargon / in Indus Land

Menes self-description:

SHAG-MAN / MA-ANSHU / BARA / GU-EDIN-AS

Viceroy / Ma-anshu / Pharaoh / in Indus Land

Menes' tomb at Abydos:

LUGAL / MIN-AS / BARA / MUS-SIR / MAD-AGA / TAB-GE

King / Minas / the Pharaoh / of Muzir (Egypt) / the Land of / the Two Crowns

Menes epitaph:

KU / MIM / WI-SU / XU-BAK GIR / A-HA / MIN-AS

The One / who Perished / in the West / of the Horus race / Aha / Minas

This last one refers to Menes' death aboard a ship on the way to his British colony at age 83.

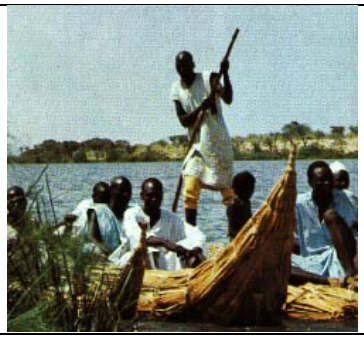
Waddell is writing in 1930, so undoubtedly there are changes that have occurred in the understanding of Sumerian, Egyptian and Indus Valley writing. However, since his translations make sense out of the Egyptological nonsense, I think that they are close to the mark.
From 1975 to 2010, Zechariah Sitchin became well-known for his 'translations' of the Sumerian cuneiform as well as interpretations of the seals. However, after reading all his books, I am not aware of very many correspondences between his interpretations and Waddell's translations. Needless to say, Waddell makes no mention of visiting aliens or rogue planets.

Waddell does, however, make sense out of the jumble of pre-dynastic times that has resulted partly from the Egyptologists' insistence on **the isolationist theory of history**. Waddell shows that the civilization of 3100 BCE was not only in control of the main centers of **Sumer, Indus, Egypt,** and **Crete**, they also brought tin from **Britain**, silver from **Spain** and cedars from the **Levant**. To that I would add copper from **Lake Superior**, tin from **Bolivia**, and gold from **Australia**. They had the ability to **travel worldwide**, as archaeological researcher and author Thor Heyerdahl proved with his expeditions in modern duplicates of their ancient reed boats.

6. Thor Heyerdahl's mighty ocean-going reed boat Ra II under construction

This ancient reed boat building technology has been preserved at **Lake Titicaca**; along **the Nile**; the marshes of **the Tigris**; and the receding shores of **Lake Chad**; showing that this complex skill was indeed worldwide, and highly advanced. Recently, it has been found that the Egyptians made pilgrimages to Lake Chad. (See my book ***The Green Sahara***.)

Egypt



Lake Chad

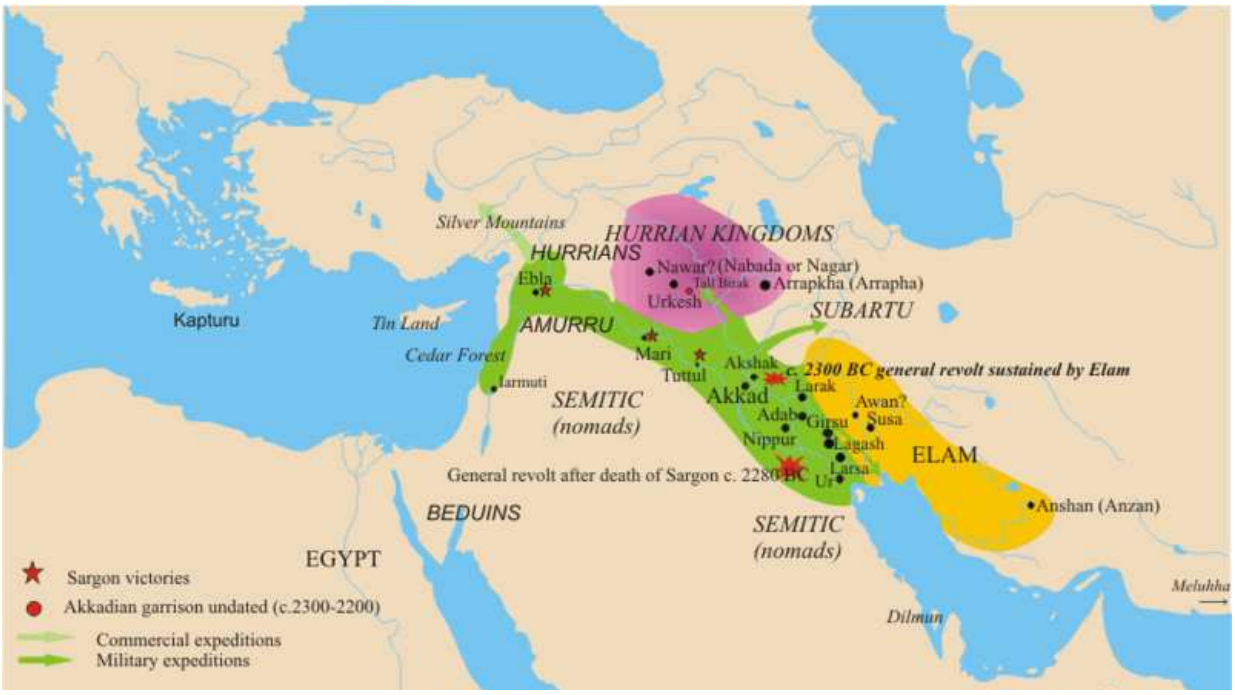
Lake Titicaca

The Voyage of the Tigris

In April 1978, Thor Heyerdahl completed a 4,200-mile voyage on a 60-foot reed ship he called **the Tigris**. Thor set sail from the banks of the Tigris River, and he and his crew navigated down the Persian Gulf to Oman and then eastward to the Indus Delta of Pakistan. Then they reversed direction and headed southwest back across the Indian Ocean in the direction of Egypt.

Heyerdahl's experiment, like his previous voyages, again proved that **early man could have successfully navigated immense distances across open seas thousands of years ago**, and could have established regular trade routes, exactly as they claimed. The Tigris, constructed of buoyant river reeds, was a fine sea-worthy vessel.

The Indus Valley civilization ruled by the Akkadian dynasty.
Dwarka has been recently rediscovered offshore under 60' of water.



Sargon's Akkadian Empire in Mesopotamia included Phoenicia, Harran and Urfa.

"*Today, quite the opposite extreme is the prevailing anthropological **orthodox dogma**; that is, that the indigenous peoples of the New World were solely responsible for the development of their complex cultures. No outside assistance or inspiration was necessary, as the peoples found there were as equally capable of cultural sophistication as the civilizations found in Asia or the West. Indeed, as is typically asserted today, it is **an insult** to suggest otherwise; and in academia, such ideas of foreign visitors to the New World prior to Columbus are considered **heresy**.*" http://www.plu.edu/~ryandp/RAX.html See John L. Sorenson www.sino-platonic.org

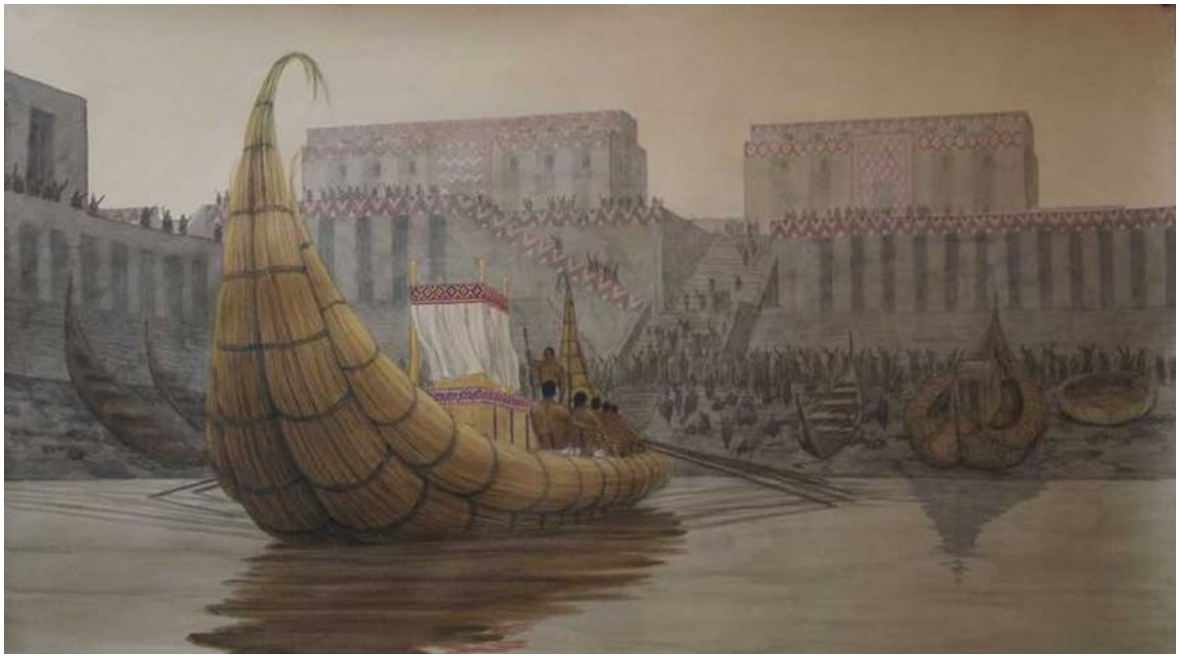
A major stumbling block that archaeologists face in envisioning the scope of this world-girdling empire is their general unfamiliarity with sailing. For them, **the sea is a great barrier**, not a viable avenue of transport. They are prepared to consider some short coast-hugging excursions, but no further. Yet, in reality, to men who know the sea and her currents and winds, **the sea is a vast highway** that goes everywhere and can be exploited to discover new resources and new opportunities. It is not a barrier, and it is safe when you know what you are doing. In fact, the places where it is least safe are the coastlines, where unseen reefs or rocks can wreck a ship. So **the reality is just the opposite** from the suppositions of landlubber archaeologists.

Sargon's Akkadians possessed the technology required to knit together such distant lands, and clearly the seaworthy reed boats were the basis of this extension. Heyerdahl's ground-breaking expeditions provided an opportunity to realize the scope of this world-girdling empire, but the landlocked archaeologists were unable to break out of their petrified paradigm. They refused to consider the abilities of the ancient sailors, nor the technology they possessed that made their voyages possible.

Crichton Miller rediscovered this device, based on the Celtic cross, and remarks:

Image credit: Crichton Miller

"***The ancients could find their position anywhere on the Earth within 3 nautical miles with this hand held device**. This instrument was probably the basis of geometry, mathematics, ancient astronomy, map making and time keeping. It was used in combination with a detailed knowledge of astronomy and monthly star positions, ecliptic and zodiac observations, so as to **locate the position of any star at any time over a location on the earth's surface.***" – Crichton Miller



Port of Eridu

The **flood of 3142 BCE**, caused when an asteroid impacted the Indian Ocean, permanently changed the Persian Gulf. Great damage was caused in the city-states north of the Persian Gulf, as **a massive tsunami** roared northward over the land. Excavations of Mesopotamian cities have discovered a deep mud layer, with polychrome pottery debris below and Akkadian debris above. The Sumerian King List claims that, after ten antediluvian rulers, the Flood swept over everything, after which kingship once again was re-established at Kish and the list of dynasties and rulers resumes. Gilgamesh, hero of his own famous epic, is listed as a king several rulers after the Flood. Losses were suffered on the west coast of India, when **Dwarka** of the Indus civilization was submerged. **It may be that an important part of the recovery strategy after the Flood was the idea of invading relatively untouched Egypt**, since Mesopotamia was covered in 10' of mud, and Dwarka was submerged. (See Appendix 7)

The question of dating remains to be resolved, since the archaeologists have pigeon-holed Sargon at c. 2300 BCE. Since his son Manis-tusu/Mizraim/Aha-Men/Menes was the conqueror of Egypt, uniting the two lands around 3100 BCE, **there is an 800 year adjustment needed in the conventional Sumerian chronology**. Many researchers are aware of the problem (such as David Rohl) and are working at syncing Egyptian, Hebrew and Sumerian histories, but they do this by attempting to shorten the Egyptian chronology to fit, as Waddell and Velikovsky did. **The problem actually comes from starting with a Hebrew chronology that is too short.**

Egyptologist David Rohl in his book **"*From Eden to Exile*"** says on page 66,

> **"***What **the Genesis author clearly did not appreciate** was that Babylon had no ziggurat or temple tower before the Old Babylonian period… The earliest mention of Babylon occurs in the reign of Shar Kali-Sharri [Shar Gani-Eri], descendant of Sargon the Great, founder of the Dynasty of Agade [Akkad]. However, **the Tower of Babel story originated from a much older incident which had taken place not long after the Flood – a thousand years** before the first mention of Babylon."*

As we shall see**, <u>the scribe was correct</u> and <u>it is David Rohl that does not appreciate</u> that the Dynasty of Sargon the Great has been moved forward in time some 800 years, from its <u>correct time in the years immediately following the Flood.</u>** First we shall look at a possible cause for the flood, then at the chronology.

7. Evidence of the Flood of Noah

The Torah describes a deluge lasting for 40 days and 40 nights that created a great flood while Noah and his family and an entire menagerie were enclosed in his Ark. The question arises: how long were they on the Ark? A close reading of the story in Genesis reveals **the interweaving of two different stories, which provide different lengths of time**. One version says they were on the Ark over a year, while the other says that they were there 40 days, followed by a week and then another week, for a total of 54 days (Genesis 8:6, 8:10, 8:12). It has long been suspected that the **Sumerian story is the original** and the Torah story is a later combination of versions. There is much evidence of the intertwining of separate stories into one in the Torah, such as the Sumerian gods Enlil and Enki being combined into Elohim (a plural word). This provides an ethical dilemma, where God the creator is also God the destroyer. In the Sumerian, there is no such problem, since Enlil seeks to destroy man, and Enki seeks to preserve his beloved creation.

In the Sumerian version, **a pillar of black smoke** on the horizon is seen before the sky went dark for a week. Then, a cyclone pummeled the Fertile Crescent and caused a massive flood. The legend tells about "the Seven Judges of Hell" who raised their torches, lighting the land with flame, and then a storm that turned day into night "smashed the land like a cup," and flooded the area. The legend says that the gods mentioned in talking amongst themselves beforehand that the flood will come from the south. What was the cause of this inundation? An **asteroid impact** in the Indian Ocean has been suggested recently.

In the case of waves generated by an asteroid impact in the ocean, the debris left in the wake of the resultant tsunami is believed to form gigantic, wedge-shaped sandy structures known as **chevrons**, which are sometimes packed with deep-ocean microfossils.

There are **dozens of chevrons** along shorelines and inland in eastern Africa and western Australia. The shape and size of these chevrons suggest that they were formed by waves emanating from the **impact of an asteroid slamming into the deep ocean off Madagascar, producing the 18 mile wide Burckle Crater.** Chevrons found 4 miles inland from the sea on Madagascar were formed by a wave that traveled along the coast, moving almost parallel to the shoreline. Preliminary results show a **c. 3000 BCE date.**

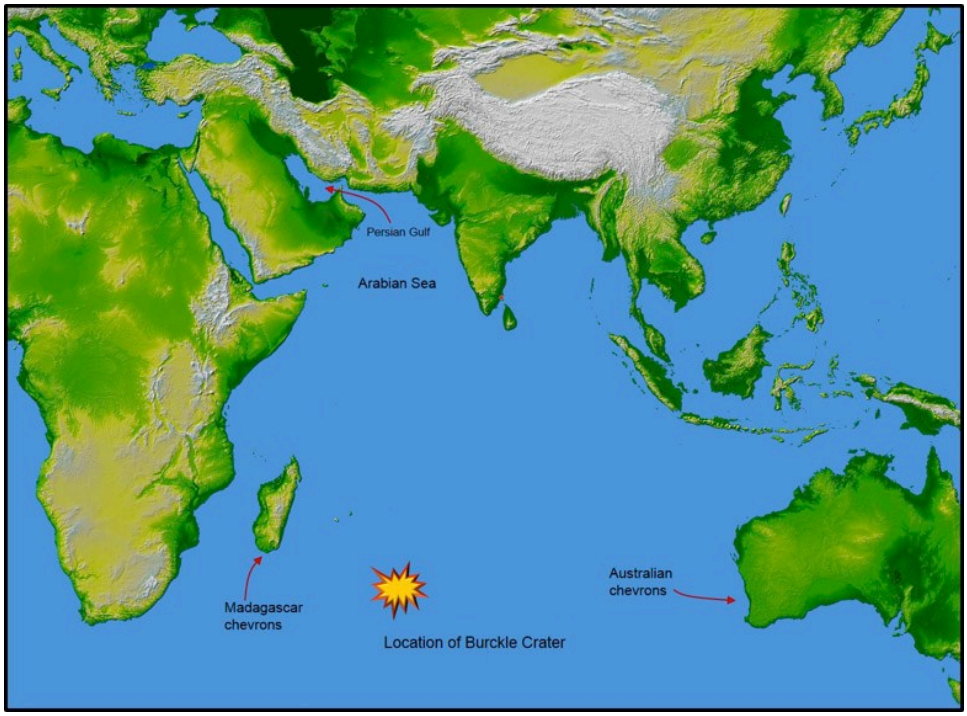
This series of enormous chevrons are on the east coast of Madagascar

So the chances of the flood being caused by a celestial impactor and the subsequent tsunami are high. The worldwide nature of Noah's flood, as opposed to Gilgamesh's more localized flood, could very well be due to **the telescoping of past events into one**. In this case, the catastrophic

ending of the ice age over 6500 years earlier was telescoped into the flood of Noah, and events of the earlier time attached to the later event. Telescoping makes it harder to get at the underlying story, because several events are amalgamated into one. (See Appendix 7).

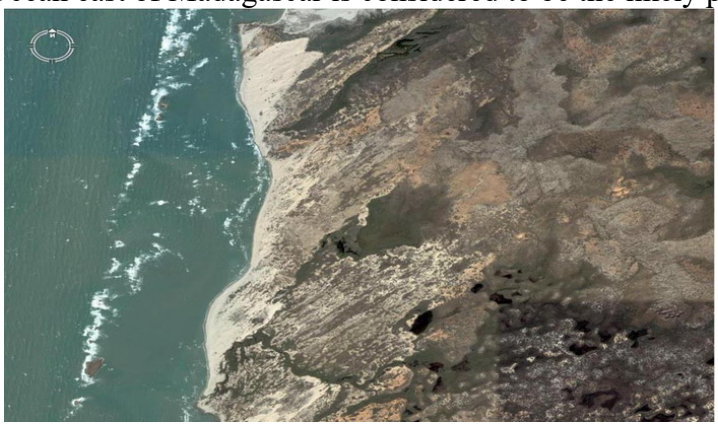
This process of telescoping was common in many of the old legends. It can be seen in the Torah where the genealogy of Moses displays telescoped historical events: there are only **three** ancestors for Moses listed in Exodus for the 400 years in Egypt; yet Joshua over the same time period has **ten** ancestors, as recorded in Chronicles.

Plato reports telescoping of flood legends in the Timaeus, where the Egyptian priest of Neith at Sais tells Solon that **the flood of Deucalion was preceded by three floods before it**, yet all the Greeks have retained in their memory is a belief in one enormous flood that drowned everyone on earth except for Deucalion and Pyrrha.



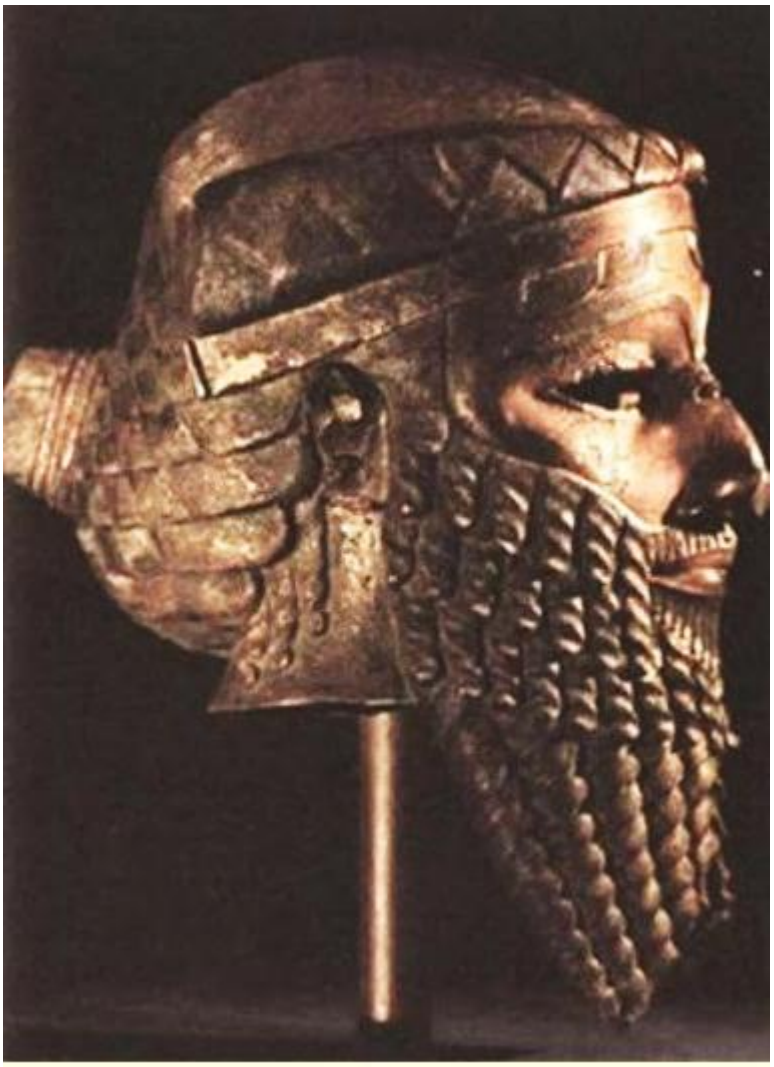
The Torah states that the Flood covered '***eretz***', which has been translated as 'the world'. But a better translation is '**the land**' as in '***eretz Yisrael***', 'the land of Israel', which is the way it is translated in over 400 other places in the Torah. So this flood covered the entire land for a couple of weeks, which is what a huge tsunami would do.

Rabbinic legends state that God caused the flood by **casting two stars to the earth**. The Burckle crater in the Indian Ocean east of Madagascar is considered to be the likely point of impact.



Tsunami chevrons on the west coast of Australia

8. Who Was Sargon the Great?



Sargon

- **The Sargon Legend**

"The Sumerian literature known as "the Sargon legend" is believed to be a text describing Sargon's life. However, most of the text is missing. The surviving fragments name Sargon's father as ***La'ibum****. After a missing section, the text skips to* ***Ur-Zababa, king of Kish****, awakened from a dream.* ***For unknown reasons****, Ur-Zababa then appoints Sargon as his cupbearer. Soon after this, king Ur-Zababa requests Sargon to come to his chambers to discuss a dream that* ***Sargon*** *had. Sargon's dream involved the favor of the goddess Inanna and the drowning of Ur-Zababa by the goddess. Deeply frightened, Ur-Zababa tries to get Sargon murdered at the hands of Belic-tikal, the chief smith, but Inanna prevents it, demanding that Sargon stop at the gates because of his being "****polluted with blood****."[?]*

*"When Sargon returned to Ur-Zababa, the king became frightened again, and decided to send Sargon to king Lugal-****zagg-esi*** *of Uruk with a message on a clay tablet to murder Sargon (the legend appears to be lost at this point; presumably it describes how Sargon becomes king). From the Sumerian king list: "In Agudu [Akkad], Sargon, whose father was a gardener, the cupbearer of Ur-Zababa, became king, the king of Agudu, who built Agudu; he ruled for 56 years."*

*"**Confusingly, Ur-Zababa and Lugal-zagg-esi are both listed as kings, but several generations apart**.*

*"The Assyrian king list calls him **"Sargon the Assyrian**," son of **Ikunum**, and reckons him as one of **their empire's founders**. A Neo-Assyrian text (seventh century B.C.E.) describes his birth and his early childhood:*

*'My mother was a high priestess, **my father I knew not**. **The brothers of my father loved the hills.** [?] My city is **Azupiranu**,[?] which is situated on the banks of the Euphrates. My high priestess mother conceived me, in secret she bore me. She set me in a basket of rushes; with bitumen she sealed my lid. She cast me into the river which rose over me. The river bore me up and carried me to Akki, the drawer of water. Akki, the drawer of water, took me as his son and reared me. Akki, the drawer of water, appointed me as his gardener. While I was a gardener, Ishtar granted me her love, and for four and 50 years I exercised kingship.'*

*"Sargon's early life as castaway baby predates the story of the biblical Moses. Sumerian legend also includes a great Flood. Lists of Sumerian kings record whether they reigned before or after this important event. While **it is unknown exactly how Sargon came to power**, he soon attacked Uruk, where reigned **Lugal-zagg-esi** of Umma. Lugal-zagg-esi was defeated, and brought to Kish. Sargon then attacked and crushed Ur, Lagash and Umma. He washed his weapons in the Persian Gulf, showing he had conquered Sumer in its entirety.*

"The governors chosen by Sargon to administer the main city-states of Sumer were Akkadians, not Sumerians. Akkadian became the lingua franca, the official language, of inscriptions in all Mesopotamia and of great influence far beyond. The former religious institutions of Sumer, already well-known and emulated by the Akkadians, were respected; his daughter Enheduanna, the author of several Akkadian hymns, was made priestess of Nanna, or Nanna-Sin, the moon-god of Ur. He also called himself "anointed priest of Anu" and "great ensi of Enlil."

*"Sargon defeated the four leaders of Elam, led by the king of Awan. Their cities were sacked; the governors, viceroys and kings of Susa, Barhashe, and neighboring districts became vassals of Akkad, and **the Akkadian language made official**. Sargon captured Mari, Yarmuti and Ebla as far as the Cedar Forest (Amanus) and the silver mountain (Taurus). Commerce routes were secured, and supplies of wood and precious metals could be safely and freely floated down the Euphrates to Akkad. The text known as "Epic of the King of the Battle" depicts Sargon advancing deep into the heart of Asia Minor to protect merchants from the exactions of the king of Burushanda (Purshahanda). It is also mentioned that Sargon crossed the Sea of the West (Mediterranean) and ended up in Kupara (Cyprus). Ancient writers saw Sargon as the king who had said: "Now, any king who wants to call himself my equal – wherever I went, let him try to go."*

"The many legends associated with Sargon ensured that his memory has been preserved. On the one hand, he is remembered for his military exploits. But it is said that no one in Sumer had to beg for food and that "widows and orphans were protected." The evidence contained in Sumerian records is that the Sumerians negotiated peace treaties whenever possible. Indeed, "The oldest known treaty, preserved in an inscription on a stone monument, is a peace treaty between two Sumerian city-states, dating from about 3100 [B.C.E.]."
http://www.newworldencyclopedia.org/entry/Sargon_I

- **Problems with the story**

That is the legend of Sargon. There are a number of problems with it. His father is given as **La'ibum** at first; shortly after it is given as **Ikunum, the Assyrian**. In another source, it is given as **Itti-Bel.** Then it says he did not know who his father was. Then it says that his father's brothers liked the hills. Just who was his father? (Note that in Genesis 10:13, **Lehabim** is listed as a son of Mizraim.)

His mother is said to have been a temple prostitute, but no reason is given for her action in setting him afloat as a babe – certain death. The man that draws him from the water is Atti, variously described as a water-drawer or a gardener. How Sargon rose from that kind of background to be cup-bearer for the king is not known. It is also not logical.

> "*A **cup-bearer** was an officer of high rank in royal courts, whose duty it was to serve the drinks at the royal table. On account of the constant fear of plots and intrigues, a person must be regarded as thoroughly trustworthy to hold this position. He must guard against poison in the king's cup, and was required to drink some of the wine before serving it. His confidential relations with the king often gave him a position of great influence. The position of cup-bearer was greatly valued and given to only a select few throughout history. Qualifications for the job were not held lightly but of high esteem, valued for their beauty and even more for their modesty, industriousness and courage*." - wikipedia

So how does the orphaned stepson of a water-drawer/gardener become the royal cup-bearer?

The Assyrians said his city of birth was Azupiranu, and that his father was Assyrian, and that Sargon was the founder of the Assyrians. That city has never been located. In opposition to this, the Torah says Asshur (son of Shem) was the father of the Assyrians.

There is a hint in the legend that Sargon was an interpreter of dreams, and thus reaches royal notice, somewhat like Joseph much later. But, incongruously, it is Sargon's dream showing the death of the king that is interpreted. The 'king Ur-Zababa' is afraid and tries to have him killed. But Sargon is saved by Inanna, wife of Zababa, who stops him, saying he is 'polluted by blood'. What does that mean? Certainly he is not **yet** polluted by blood, although he soon will be.

The name Zababa is known to be the name of a **patron deity of the city of Kish, not its king.** The 'king Ur-Zababa' sends Sargon to king Lugal-zagg-esi of Uruk with a tablet asking that he be killed. '**Lugal**' means King, so he is **King Zagg-esi**. '**Zag**' is strength; '**esi**' is 'much'.

Waddell says that King Zagg-esi is a usurper of King Ziusudra, Sargon's father. Sargon overthrows the usurper Zagg-esi and then succeeds him to the throne of Kish. The first king of Kish after the Flood in one of the Sumerian King Lists after Ziusudra is **Gishur,** as I said earlier. 'Shur' or 'Shar' is 'King' in Sumerian (surviving to this day as Shah in Persia/Iran). So this is really King Gi ('gi' is 'reed'). Sargon was called Shar Gi. So this is strong evidence that this first king was Sargon, son of Ziusudra, restored to his rightful throne.

Sargon's name in Babylonian is **Ni-lu-ba-ni**. This means "**borne on the flood waters**". That would be a good description of Noah's sons. Ziusudra saves his sons from the flood, but unfortunately their names are not given.

If Ziusudra/Noah was Sargon's father, then **Sargon is Ham** (Kham). His sons would then be Cush (Kish), Mizraim (Manis), Phut/Pun (Libya) and Canaan (Canaanites). Since we have seen that **Mizraim = Menes**, then **Sargon = King Ka of Abydos**. He conquered Egypt, and then his rebellious son Manis/Menes re-conquered it and seized it for himself.

Sargon spent much of his time away from home on campaigns subduing the city-states and tribes all the way to the Mediterranean. His son Manis was equally ambitious. Sargon made his second son, Rimush, viceroy in Akkad, and sent his first son, Manis, to the Indus Valley to act as viceroy there, but Manis was not satisfied and after a couple of years, he left with 60,000 troops and sailed to the south Arabian coastal states. He defeated the coastal Arabian kings, sailed round the Arabian Peninsula into the west arm of the Red Sea, and then proceeded to bring his boats overland through the dry wadis to the Nile in Upper Egypt at Koptos. In a relentless campaign, he succeeded in re-conquering Upper and Lower Egypt and for the first time, uniting the two into one country with two crowns. The men that Menes led were called **the Followers of Horus**, and as we saw earlier, **Horus = Noah = Ziusudra**.

Sargon then moved into the Mediterranean to counterattack Mene's forces, but that battle never seems to have taken place. Eventually, Sargon died and was then buried at Abydos as King Ka, along with his queen, Ash-Nini. So there must have been some kind of reconciliation between Sargon and Menes to head off the encounter, and mend fences.

Modern scholars consider Sargon to be a Semite, that is, a descendant of Shem after the Flood. However, Waddell disagreed. If the identification of Sargon with Ham is correct, then obviously, **he would be a Hamite**, supporting Waddell's position. And, by the color of his skin, Sargon would be descended from Dravidians, who were the tribe now called **Ubaidians**. The Dravidians fused with Arians and proto-Elamite herdsmen in 5400 BCE to build Eridu, as the archaeological evidence shows.

Sargon was a cross between Azilian and Dravidian. He married the Azilian woman Ash-Nini, and thus his sons and grandsons were light-skinned.

See my book "***The Five Great Migrations of the Azilians***".

9. Chronology of the Torah Patriarchs

Patriarch	Born BCE	Age at birth of son	Length of life	Died BCE
Adam	5404	230	930	4474
Seth	5174	205	912	4262
Enosh	4969	190	905	4064
Kenan	4779	170	910	3869
Mahaleel	4609	165	895	3714
Jared	4444	162	962	3482
Enoch	4282	165	365	3917*
Methuselah	4117	187	969	3148
Lamech	3930	188	753	3177
Noah	3742	501	950	2792
3142 : The Great Flood happened when Noah was 600				

So now we have the date of the Great Flood:

3142 BCE

There were seven early civilizations at the time of Noah's Flood. They were located in: Sumeria, Indus Valley, Egypt, Crete, Anatolia, China and Mesoamerica. Archaeological records such as ruins of cities, tools, pottery, skeletons, weapons, and other artifacts support whatever written records survive:

The Akkadian empire was founded by Sargon the Great in	**3132 BCE**
The Indus Valley civilization has a history dating back well before	**3100 BCE**
Egypt's dynastic history starts with the uniting of Upper and Lower Egypt in	**3113 BCE**
The Minoans on Crete started making bronze about	**3100 BCE**
The Olmecs migrated from Africa to Mesoamerica (calendar begins)	**3113 BCE**
China's Longshan culture began about	**3100 BCE**

The pattern is clear.

If we look at what the **Masoretic text** shows for the Flood, we find the date of **2348 BCE.**
Sargon the Great's date is conventionally set at 2334 BCE (middle chronology**).**
This would mean that Sargon was actually king soon after the Flood.

But, the **Masoretic** Flood date is 3142 – 2348 = **794 years younger** than the date given in **LXX**.
Nearly 800 years from Adam to Noah has been dropped out of the original LXXa by the Masoretic changes and **nearly 800 years** has been dropped out of Sargon's date.
Restoration of the nearly 800 years allows identification of his son:

Menes is Mizraim

"The examination of names is the beginning of learning." – Socrates

10. Menes = Mizraim

Compare the two:

Mizraim	Menes
His father was Kham, after whom Egypt was named initially (Khem)	His father was Ka/Kad, after whom Egypt was named initially (Khem)
He had an older brother, Cush, whose descendants are still in the area	He had a younger brother, Rimush, who ruled in Kish before him
He lived after the flood of Noah, dated to 3142 BCE by the LXX chronology	He lived after the flood in Sumeria c. 2900 BCE (carbon 14 dating, 240 years too young)
He was the progenitor of the Egyptians, and his name Misr today still means Egypt	He conquered Egypt by dragging boats overland to the Nile, unifying it c. 3100 BCE
Horus was Noah, his grandfather	He led Shemsu Hor, the followers of Horus
He was known by many names in many lands	He was known by many names in many lands
He had a nephew Nimrod who succeeded him	He had a son Narmar who succeeded him

The testimony of the ancients:

- Herodotus called the first Egyptian king …… ***Menes***
- Sanchuniathon called the first Egyptian king.……..... ***Misor***
- He built the city of Memphis, called by the Turks ……. ***Mitzir***
- Ugaritic inscriptions refer to Egypt as ……. ***Msrm***
- In the Amarna tablets, Egypt is called.……. ***Misri***
- Assyrian records call Egypt ……. ***Musur***
- Babylonian records call Egypt ……. ***Musri***
- Manetho stated that the great spans of time which the later Egyptians boasted of had actually **preceded** the flood, and that **they were really descended** from …….. ***Mizraim***
- Medieval Islamic historians Sibt ibn al-Jawzi, the Egyptian Ibn Abd-el-Hakem, and the Persians al-Tabari and Muhammad Khwandamir, stated that the Giza pyramids had been built by the race before the deluge, but afterward the area was inhabited by **Noah's descendant called ……..** ***Mizr***

- **The Book of Sothis by Manetho**

The Book of Sothis is not accepted as a genuine tome from Manetho, but the grounds for that dismissal are tissue thin. There is a dedication phrase in the introduction that uses the word "august", which is an anachronism. But, it is common to have insertions by later translators and copyists, as has happened in Josephus. This is no reason to completely dismiss the rest of the contents. The monk that has transmitted it, George Syncellus, c.800 CE, is considered reliable in all other matters. Considerable portions of the original text of the ***Chronicon*** of Eusebius have been restored by the aid of George's reliable work.

Syncellus states that Manetho included information from monuments in "the Siriadic land" (Egypt, oriented to Sirius), that had been engraved before the Deluge, and afterward had been copied and stored in hieroglyphic books in Egyptian temples. Manetho says in his book that

Menes is Mizraim.

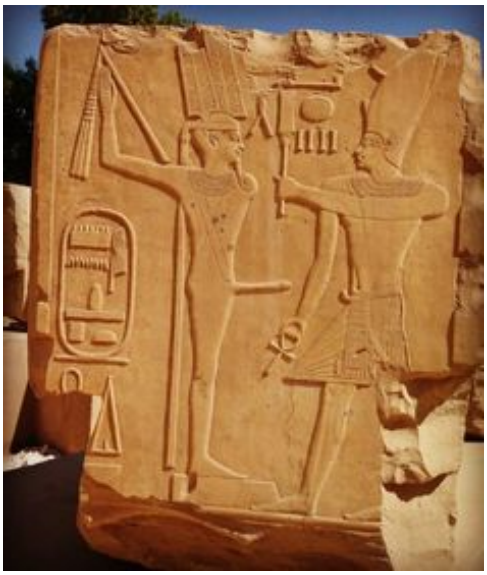
The argument that King Menes is also to be equated with **King Aha (Hor-Aha)** is put forth in the book ***Chronicle of the Pharaohs*** by Peter A. Clayton:

> "***Hor-Aha**, his [Narmer's] successor [*sic*], and therefore probably his son, possibly by Queen Nithotep, stood to inherit a unified kingdom, both by right and by conquest. He took the nebti name ... of **Men**, which means 'established', and this could be the origin of the later record of the first king as being called **Menes**. For present purposes we may look on **Hor-Aha as the first king of the 1st Dynasty**. An interesting piece of evidence is a small broken ivory label found in the tomb of Queen Nithotep at Naqada. Although schematically represented, the busy scene on this tiny piece seems to show two humans celebrating a ceremony called 'Receiving the South and the North'... The king's name, meaning 'Fighting Hawk' – an allusion again to Horus – indicates his Upper Egyptian origin and rule. His adoption of Men as his nebti name for ruling over both parts is indicated on the ivory label by the fact that his Horus name... **Hor-Aha, and his nebti name, Men**, appear side by side.*
>
> *Other similar small labels from Early Dynastic tombs indicate that his was not an easy reign. There were campaigns to be fought and rebels to be subdued in Nubia as recorded on a wooden label from Abydos; another label records his foundation of a temple to the **goddess Neith at Sais** in the Delta. Her warlike aspect was signified by a pair of crossed arrows and her worship continued into Roman times when she **was identified with Athena at Sais.***"

"*As crown prince of the Sumerian/Akkadian Empire, **Manis was made viceroy** and governor of the **Indus Valley**. As such, he controlled the local **Sumerian army** of occupation in the Indus, and **the great merchant fleet** plying between there and the port of Lagash. This fleet also voyaged to Magan (Oman) and Egypt via the Arabian coast and the Red Sea. Manis rebelled against his father Sargon, and Sargon installed **Uru-Mush**, his younger brother as **King of Kish** in his stead. In this rebellion, **60,000 of the troops of the Indus** followed Manis, and he re-conquered the lands along the coastline of the Arabian Peninsula, on his way to Egypt. The great ships were dragged overland through the dry wadis on rollers, and then launched into the Nile at Koptos in Upper Egypt. From there**, **Manis/Menes re-conquered Egypt**, **overthrowing his father's regime there,** uniting Upper and Lower Egypt, and setting himself up as the new pharaoh. At Koptos, there are the **oldest known statues in Egypt**, indicating the overland Red Sea route taken by the invaders. The statues are two 9' limestone figures of Min. They bear signs of Red Sea shells and swordfish. **This god Min is none other than the deified Manis.**" - L.A. Waddell, p. 54-55

Min with appendages restored

Nine foot tall statue of Min from Koptos



"*Min was a god of the Eastern Desert, and a patron of traveling caravans. A reference in the Pyramid Texts to* ***"the one who raises his arm in the east"*** *is thought to relate to Min. He offered protection to travellers and traders and was also worshiped by the miners and masons who worked around the Wadi Hammamat. In this area, he was known as "Min, the (foremost) Man of the Mountain". His association with the desert led to* ***an association with foreign lands.***

"*Min was closely associated with* ***fertility and agriculture****. In depictions of one of Min's festivals, the pharaoh hoes and waters the ground while Min watches. In another, the Pharaoh ceremonially reaps the grain. However, Min was not just a fertility god, but a patron of* ***male sexuality*** *who could help men to father children. When the pharaoh successfully fathered an heir, he was identified with the god. As he represented male virility, it is not surprising that it was he who presided over the Heb Sed festival, in which the pharaoh ran a course carrying ritual objects to rejuvenate him and to prove his virility*.

"*Min was generally depicted as a* ***mummiform human man with an ithyphallic (erect and uncovered) penis wearing a crown with two large feathers*** *(like that of Amon). In his left hand he holds his penis and in his right hand he holds a flail up above his shoulder. The flail represents Pharaonic power and fertility (it was used to thresh grain and remove the hull) and it is suggested that* ***the position of his arm replicates the stance associated with Orion****; and that the position of his arm in relation to the flail represents sexual intercourse (with the flail outline representing a vagina and his arm representing a penis). When he is* ***represented as the constellation Orion*** *he can be distinguished from Osiris because the three bright stars of Orion's belt are made to represent his erect penis. Nineteenth century scholars mistranslated his name as Khem*." [Khem was actually his father, Sargon]http://www.ancientegyptonline.co.uk/min.html

The Pharaoh Menes	**The God Min**

He looks white-skinned, which would mean that his father Sargon's wife, Ash-Nini, must have been Azilian. Acromegaly with its giantism and coarsening of features seems likely.

Min, the eternally priapic; Min/Menes (ruled 3113 – 3050 BCE)

"All gods were once men, whose real feats have been decorated and distorted by later fancy."
- Eumerus (316 BCE)

- **King Menes is the first of a very long line of depictions of the 'man with the upraised right arm', which are analogs of Orion, throughout history.**

The **Vinča** tribe lived in settlements left behind in Bulgaria by the migrating Arian/Azilians in 6000 BCE. They were skilled coppersmiths, the first in the world. Raiders from the northern steppes began to harass them in the years after the flood (3142 BCE). They were driven southwards until they were at the Adriatic. Menes heard of their plight and took his powerful fleet of tamarisk ships to the Adriatic shores and rescued them. He resettled them on Crete, where they became the producers of bronze for his empire, using tin from Bolivia and copper from Minnesota. He gave them a constitution. They called him Minos. Their language was used on Crete and has come down to us as the undeciphered **Linear A**.

Menes also took his fleet to Nigeria and transported the Olmecs to Mesoamerica around this time. Their calendar begins in 3113 BCE, his year of victory in Egypt.

The Dogon of Mali received information about Sirius A and B from Menes' crews at the same time.

So many of the loose ends of history are tied up with this information on the world emperor Menes/Manis/Manja/Minos.

- **The Manis-Tusu "Black Obelisk"**

"*One of the most famous and important of the monuments left by King Manis-Tusu is his famous "**Black Obelisk**" now on display in the Louvre. Its record is a striking illustration of the **very advanced constitutional government which King Manis-Tusu administered**; and discloses him as **a most enlightened ruler and respecter of the rights of private citizens**. The text records the purchase of several large estates in the neighbourhood of **Kish, his capital city**, which he required for his official buildings and for the estate of his son. Instead of confiscating the necessary land and buildings already occupied, he purchased it legally at its full market value, by silver, with additional lavish gifts for the goodwill of the people who were dispossessed, **just as if he were a private citizen himself**. The precise area of each estate is given, and its value is reckoned in standard measures of grain and then converted into its equivalent in silver. **An***

additional one-tenth of the purchase price *was paid to each owner in* ***cattle, garments, vessels****, etc. for good will. All the names of the sellers with their addresses are duly recorded. And the names and duties of the forty-nine government overseers entrusted with the administration and cultivation of the lands are detailed closely*." – L.A. Waddell, p.53

Manis-tusu "Black Obelisk"

- **Menes' exploits:**

"*Manis-Tusu,* ***King of Kish*** *(Cush) City, when Anshan (Persia) and Shu-Edin-hum (****Indus Valley****) he had smitten, the Lower Sea (Persian Gulf and Arabian Sea) in ships he crossed it.* ***Thirty-two kings of cities on the other (****west****) side of the sea*** *had rallied to battle and he defeated them, and their cities he smote, and their lords he cast down and he destroyed the whole country as far as the Silver Mines. The mountains beyond the sea, their diorite stones he cut, and he fashioned his statue and dedicated it to Lord Sakh. Whoever should destroy this inscription, may Lord Sakh and the Sun god Utu tear out his foundations (testicles?) and destroy his seed*."

This is a record of his attack on the eastern Arabian peninsula coastal states after he had left Indus **on his way to invade Upper Egypt**. This was a re-conquest of the lands within his father's empire.

The Ebony Labels found in the tomb of Menes in Abydos contain an account of Menes' tragic accidental death during a voyage by sea to Britain. The Labels state that the tablet of wood laid in the tomb was only a cenotaph. The inscription is in Sumerian, as Waddell has shown. Menes is described as "***King Manash, the Pharaoh of Egypt, the Land of the Two Crowns"*** and "***the son of the Great Sha-Gana, of the Sun Hawk race, the Pharaoh***". "***The Commander-in-Chief of Ships, Pharaoh Manash, completed his trip to the end of the Sunset Land, and built there a holding in Urani Land. At the Lake of the Peak of the Far Western Land****,* [Cornwall], ***the King of the Two Crowns***" met his death through the sting of a wasp.

This account is confirmed in Egyptian inscriptions of later times which state that after a glorious reign of 62 years, the great King was killed by a 'kheb' which came forth from the waters of the

Nile. Previously, 'kheb' was translated as 'hippopotamus', but Waddell points out that there is another translation of that same word, and it is '**wasp**'. He shows that the pictogram for 'kheb' is indeed a wasp.

Waddell identifies the land '**Urani**' as Erin, or **Ireland**. Further, he states that Menes and his men created **Newgrange** in the Boyne Valley, as well as **Knock-Many** in County Tyrone. (Of course that is Knock-Mene.) At this site, Waddell translates Sumerian pictograms that include the words 'Urani', and 'Kheb'. Waddell reports that the inscriptions were removed by caustic chemicals and vigorous scrubbing in 1928, ostensibly to remove lichen overgrowth. But he shows photographs taken by a Mr. Welch before the damage was done, in order to provide proof of his claims. The **spirals and cup marks** were also made by these Akkadian/Egyptians, and also feature on Menes' cenotaph inscription at Abydos.

"Newgrange was constructed about 3,200 B.C. Newgrange is now recognized to be much more than a passage tomb. **Ancient Temple** is a more fitting classification, a place of astrological, spiritual, religious and ceremonial importance. The amount of time and labor invested in construction of Newgrange suggests a well-organized society with **specialized groups** responsible for different aspects of construction."
http://www.newgrange.com/

Engraved front stone at Newgrange

The spirals are psychic defense shields. Also seen at Tarxien, Malta.

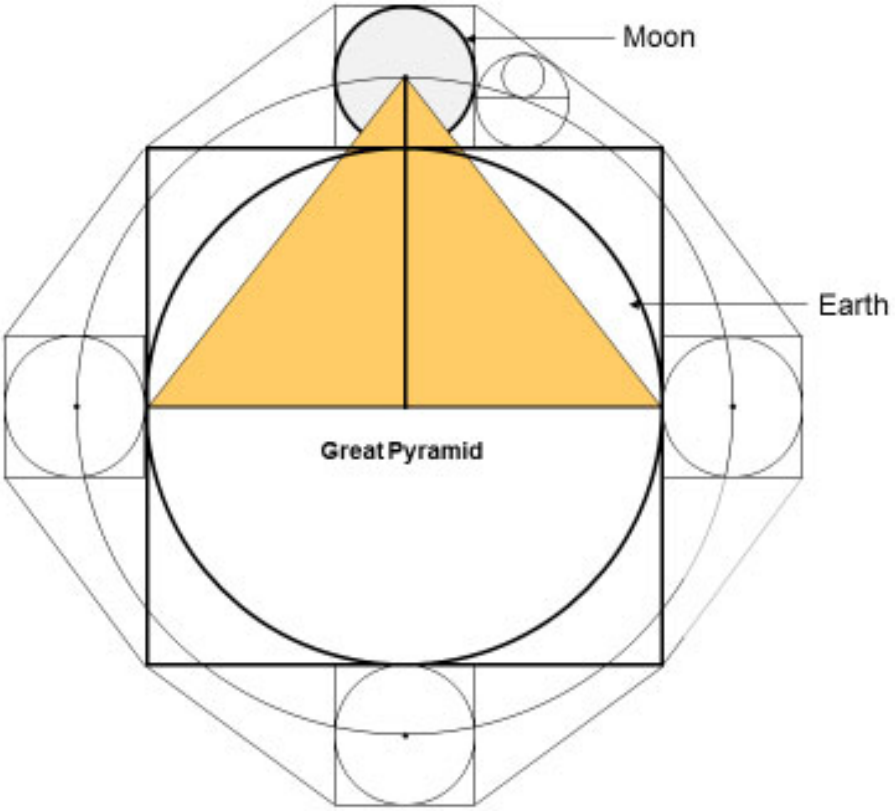
The latest information on Stonehenge has it being built around 3100 BCE, which is exactly our time frame.

The marvelous design and its utility as a marker of the seasons and the movement of the sun and the moon and eclipses mark it as an achievement of high culture. There are Minoan daggers carved on one stone, showing that Minoans were in Menes' crew.

Minoan daggers carved on a Stonehenge pillar	**Minoan dagger**

From Giza to Newgrange
The angle shown here is the special angle of the exterior casing of the Great Pyramid

The Great Pyramid was built 700 years before Menes conquered Egypt in 3113 BCE



When the Moon sphere is brought into proximity to the Earth sphere
and the center of the Moon is connected with the ends of the earth's diameter,
a special angle is created, which was used by the builders
for the slope of the exterior.
Egyptian legend attributes the construction to Thoth,
equivalent to Enoch (4282 - 3917 BCE).
Enoch was taken up bodily and communicated from on high with
his son Methuselah on Earth,
who acted as the foreman for the construction, completed in 3813 BCE.

11. Narmar/Naram-Enzu/Nimrod/Karam-Ba/Mino-Taur (ruled 3049 – 2993 BCE)

Narmar

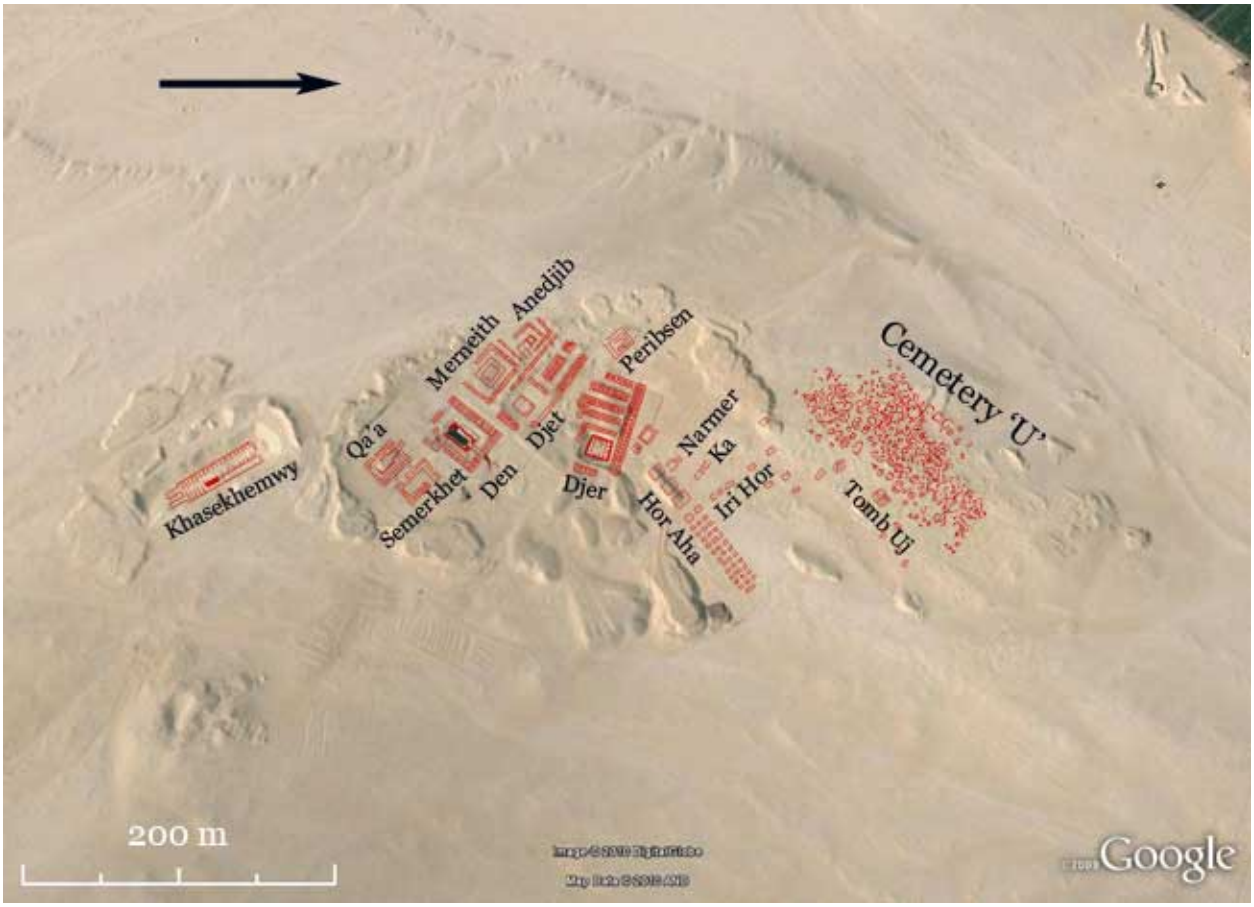
King Narmar referred to himself as "King of the Four Quarters of the World". On his Egyptian palette, Sumerian cuneiform proclaims him "The One King of the Land of Akkad, Kish and Ur" and "King of the Western Sunset Land and Tyana". (The **western sunset land is Britain**, and **Tyana** is southeastern Anatolia). On his standards, he is also called "The Great Sea-Lord of the Lands and Waters, Pharaoh of the Sun-Hawk Line" and "The Great Sea-Lord of the Lands of the Seven Seas".

Egyptian hieroglyphs are a modified form of the Sumerian diagrammatic picture-writing which came into use during the rule of Menes and the 1st Dynasty pharaohs; they have the same phonetic values as their parent picture-signs in the Sumerian.

Note that in all depictions, Naram-Enzu/Narmar is always shown as much larger than the humans around him. Conventionally, this is thought to be artistic licence showing the great importance of the king. But, it is actually because **he was an acromegalic giant, like his father**.

12. The Tombs at Abydos

The Egyptian tombs provide solid evidence reinforcing the information from Sumer. The tombs exhibit the names of Sargon (Ka), Menes (Hor-Aha/Aha-Men) and Narmar (Naram-Enzu).



Ka/Kad/Kat/Kham/Sargon	Hor-Aha/Aha-Menes/ Mizraim/Manis	Narmar/Naram-Enzu/Nimrod

The names of the Dynasty 1 Sumerian kings found at Abydos.

In 1991 David O'Connor uncovered a fleet of tamarisk (salt cedar) boats buried in enormous graves at Abydos. There were 14 ancient boats, each buried in its own brick-lined tomb adjacent to Aha-Men's enclosure. The boats, which measured up to 75 feet long, were expertly crafted and had been fully functional when buried. They proved to be the world's oldest surviving boats built of planks (as opposed to those made of reeds). They were manned by Menes' 60,000 man Dravidian army that set sail from the Indus in 3114 BCE.

The Sumerian City of Uruk

13. Trade Routes, Mining and Technology

The Isle Royale area around Lake Superior has had an estimated 500,000 tons of copper ore removed. Intense heat was used to heat the rocks to high temperatures and then they were doused with water. The rock would split, and then stone hammers would break it into sizes that could be lifted out. **The technique they used for applying heat at the temperatures required in the bottom of the pits is unknown** at this point. The huge numbers of stone hammers employed were marvels of craftsmanship, unsurpassed by modern hand manufacture**.** A sophisticated irrigation system was also installed in the pits to supply the water. Legends of the natives credit the effort to **the Marine Men, fair-skinned sailors who arrived from over the sea.** Dating for the beginning of this mining period has been set at about 3000 BCE, which is our date of interest. Genetic studies of the Algonquin people of this area show they have haplogroup X in 25% of their gene pool, strong evidence of contact with European visitors.

A man carrying a copper 'oxhide' ingot in Crete.

The standard shape made them easier to handle

- **Copper Mining in Minnesota**

"Located in Lake Superior in northern Michigan, Isle Royale is one of the most interesting ancient sites in America. Because of a freak volcanic event that twisted the copper-bearing bedrock above the water line, thus allowing all the sulfur impurities to burn away in the open air, the copper at Isle Royale is the purest found anywhere in the world. The entire region is scarred by ancient mine pits and trenches up to twenty feet deep. Carbon-dating of some wood fragments found in association with the pits have yielded dates up to 5000 years old.

The most conservative estimate calculates that over 500,000 tons of copper were taken from the mines. At the other end of the spectrum is a 1961 estimate of 1.5 billion pounds of copper mined. There is copper in American mound graves but not in this kind of immense volume.

Traditional researchers have refused to analyze European bronze for its Michigan copper signature. It is therefore not possible to absolutely state that the copper was exported to Europe. What researchers have determined is a continuous history of mining activity that began perhaps as early as 3000 BCE, and then abruptly ended about 1450 BCE, contemporaneous with the enormous volcanic explosion of the Cretan isle of Thera (Santorini) which wrote finis to the Minoan culture. Since rock-cut pictures of Cretan trading vessels have been found in the Isle Royale area, this lends credence to the Minoan connection to North America as far back as 5000 years ago."

- "*The Ancient Giants Who Ruled America*" – Richard Dewhurst, 2014

Ore found on a sunken vessel near Cyprus (Uluburun) tested as high purity with a small amount of silver in it. Those are the hallmarks of Isle Royale copper.

Native copper mass in situ on Isle Royale

Cargo reconstruction of Uluburun shipwreck
off the coast of Turkey, carrying Isle Royal copper and Bolivian tin

14. Bolivia

The *Fuente Magna* of Pokotia, Bolivia

The *Fuente Magna* bowl was found near Lake Titicaca about 75 km from the city of La Paz, Bolivia. The *Fuente Magna* is beautifully engraved in earthen-brown both inside and out and bears zoological motifs and anthropomorphic characters within.

A controversy arose about the cuneiform script on the *Fuente Magna*. Dr. Alberto Marini, translated it and reported that it was Sumerian. After a careful examination of the *Fuente Magna*, linear script Dr. Clyde A. Winters determined that it was probably Proto-Sumerian, which is found on many artifacts from Mesopotamia. An identical script was used by the Elamites called Proto-Elamite.

Winters gave the following translation:

"(1) Girls take an oath to act justly (in this) place. (2) (This is) a favorable oracle of the people. (3) Send forth a just divine decree. (4) The charm (the *Fuente Magna*) (is) full of Good. (5) The (Goddess) Nia is pure. (6) Take an oath (to her). (7) The Diviner. (8) The divine decree of Nia (is) , (9) to surround the people with Goodness/Gladness. (10) Value the people's oracle. (11) The soul (to), (12) appear as a witness to the [Good that comes from faith in the Goddess Nia before] all mankind."

" (1) Make a libation (in this) place for water and seek virtue. (2a) (This is) a great amulet/charm, (2b) (this) place of the people is an area of the deity [Nia's] power. (3) The soul (or breath of life). (4) Burn much incense, (5) to justly, (6) make the pure libation. (7) Create the pure libation as a witness to (8) Divine good in the presence of the deity's power."

This decipherment of the inscriptions on the *Fuente Magna* indicates that it was used to make libations to the Goddess Nia to request fertility, and to offer thanks to the resources in the area that made it possible for these Sumerian explorers to support themselves in Bolivia.

It was a libation bowl used by a priest onboard one of the many sailing ships that the Akkadians used to cross the Pacific to retrieve tin ore from Bolivia and copper ore from Isle Royal, Lake Superior. These were highly skilled sailors in seaworthy ships. – SP

15. **The End of the Early Bronze Age**

Not long after Abraham migrated from Harran into Canaan, he was involved in a series of skirmishes with powerful Mesopotamian kings. He sent his 300 men to attack at night guerilla-style and slayed Hammurabi's troops as they sleep. This is reminiscent of the Sicarii (dagger men) who would haunt the Romans 2000 years later.

"The dating for Hammurabi was originally prompted by information contained in an inscription of **Nabonidus**, the last king of Babylon, who reigned in the sixth century until the conquest of his land by Cyrus. Whereas his son and co-ruler, Belshazzar, occupied himself with the administration of the land, Nabonidus indulged in an avocation: he showed a marked interest in archaeology, and excavated the foundations of ancient temples, looking for old inscriptions.

"In the foundations of a temple at Larsa, Nabonidus found **a plaque** of King Burnaburiash. This king is known to us from the **el-Amarna** correspondence in which he participated. On that plaque Burnaburiash wrote that he had rebuilt the temple erected **seven hundred years before by King Hammurabi**. The el-Amarna letters, according to conventional chronology, were written about 1400 BCE. Thus, if Burnaburiash lived then, Hammurabi must have lived about 2100 BCE." http://www.varchive.org/ce/hammurabi.html

<u>The Corrected Chronology Shows</u> **Hammurabi's reign is 2082 – 2040 BCE, and** **Akhenaten's reign is 1381 – 1364 BCE** **2082 – 1381 = 701 years** **The plaque is correct and Hammurabi's time is anchored.**	 **Stele of the code Hammurabi**

The LXXa version of the Torah gives the name of the Elamite king in the battle as Chodor Logomor. His name in the discovered tablets is given as Kudur-Lagamar. Close enough – only the unnamed vowels are different.

What other event in Abraham's life might align with Hammurabi's reign? There was the utter **destruction of Sodom** when Abraham was 100 years old, in **2040 BCE.**

Recently, there has been speculation that the events described in the story of Sodom and Gomorrah referred to a meteorite shower of great intensity. A multi-disciplinary conference held in England in 1997 heard evidence drawn from various expeditions that have discovered what are believed to be materials resulting from meteorite strikes in many locations in the Middle East, along with evidence of great conflagrations caused by air bursts as meteors exploded. This data provides evidence confirming the accounts of the destruction of Sodom and Gomorrah and other cities by 'fire and brimstone from heaven'. The religious attribution of this cataclysm to divine displeasure need not concern us, since all such events were 'explained' by the priesthood in such a manner, in an effort to increase their grip on the people. But the confirmation of these events at this time further cements **the association between Abraham and Hammurabi**. This confirms the re-dating of the Hebrew and Mesopotamian tribes.

Iraqi impact crater dated to 2040 BCE

Cloudy with a chance of fireballs….

16. Conclusions

From the preceding information we can now state:

1) The Dynastic Race Theory is proven. Menes and his followers, the Shemsu Hor, entered Egypt dragging their ships overland and conquered the nomes, unifying the country.

2) The Sumerian/Akkadian Dynasty quickly re-established itself following the Flood and controlled Sumer/Akkad, Indus Valley cities, Egypt, Crete and Britain. A worldwide seafaring and trading culture exploited the resources of the planet. Maps were made, copper and tin were mined, and sea voyages went to the Indian, Pacific, and Atlantic Oceans. The Akkadians were allied with the Egyptians, the Phoenicians, the Libyans and the Cretans in these voyages. When the Akkadian Dynasty fell to the Gutians, the others continued, supplying the vital bronze industry with copper and tin. The ores were smelted in Crete into bronze.

3) The bearded white culture-bringers of Mesoamerica were the sailors, traders and miners of the worldwide Akkadian empire.

4) The occurrence of Noah's Flood in 3142 BCE as an Indian Ocean event is now established, with the impetus being a celestial impactor. Much of the worldwide impact of the earlier impactor at the end of the Ice Age in 10,900 BCE was telescoped onto Noah's time, as Plato points out in *Timaeus,* when the Egyptian priest says, *"you remember one deluge only, and there were many of them."*

5) Noah is the equivalent to Ziusudra, Horus and Zeus. The sons of Noah are the progenitors of Middle Eastern kingship, through the descendants of Ham and Shem.

6) Ham is the illustrious Sargon the Great of Akkad. His tomb is at Abydos.

7) Mizraim is the great Menes who unified Egypt, commanding the Shemsu Hor. His tomb and his boats are at Abydos. Early Egyptian architecture and Egyptian hieroglyphs are Sumerian.

8) The Akkadian Dynasty was a worldwide empire for over 200 years following the Flood.

9) Menes built Newgrange and other sites in Ireland, Stonehenge in Britain, and Maltese temples as well. Menes was Minos on Crete, and his son Narmar was Mino-Taur.

10) Menes was deified and worshipped as Min in Egypt. His cult center was at Koptos, where he brought his ships on rollers through the desert to the Nile c. 3100 BCE.

11) Early Peruvian architecture has Egyptian roots. Mummification was taught to the Peruvians and cocaine and tobacco were trade goods sent to Egypt, along with tin, silver and gold. Tiahuanaco and Ollantaytambo display the Egyptian Benben symbol.

12) The history books in our schools are full of fairytales, evolutionary claptrap and buried evidence. Meanwhile the folly of the fundamentalists presents the only opposition. Both sides are wrong, in the light of the evidence herein revealed.

Now it is time to rewrite the history books.

Appendix 1

Mummy DNA Proves Ancient Egyptians Descended From Ham, Son of Noah

Adam Berkowitz June 22, 2017

In a scientific first, DNA taken from Egyptian mummies has been decoded, producing unexpected results about the true origins of the Egyptian people. These results confirm a controversial theory that traces the First Egyptian Dynasty back to Biblical Ham, as described in the Book of Genesis.

Scientists have long been baffled by the origins of the Egyptian people. Until now, there was no empirical data to clarify the issue. The study of Egypt's population history could only draw on literary and indirect archaeological references, and inferences made from genetic studies of present-day Egyptians. Based on these sources, most researchers believed that ancient Egyptians came from nearby northern Africa. Egyptians today exhibit a significant sub-Saharan genetic influence.

This scientific belief long contradicted the Biblical account, which designates the forefather of Egypt as being Mizraim, a son of Ham.

Of these were the isles of the nations divided in their lands, every one after his tongue, after their families, in their nations. And the sons of Ham: Cush, and Mizraim, and Put, and Canaan. Genesis 10:5-6

According to the Bible, Mizraim settled in Egypt whereas Cush settled in Africa, establishing two distinct and separate nations that did not share a common heritage. The scientific theory implies the origins of Africa and Egypt were the same.

A recent study of the DNA of mummies, led by Johannes Krause of the Max Planck Institute for the Science of Human History, has shed some light on the subject, and his findings support the Biblical narrative.

Previous attempts to study the DNA of mummified remains were inconclusive. The hot climate of Egypt combined with the embalming process practiced by ancient Egyptians destroyed most DNA. For this study, researchers sampled 151 mummies from Abusir el-Meleq, about 60 miles south of Cairo. Their samples spanned 1,300 years of ancient Egyptian history, from about 1388 BCE to 426 CE.

The researchers were able to collect 90 samples of mitochondrial DNA and three samples of genomes, the total of an organism's DNA. The surprising results showed that ancient Egyptians were more closely related to populations from the Near East and southwest Asia, and not from northern Africa as previously thought.

"In the ancient Egyptians, we don't find much at all sub-Saharan African ancestry," Krause told *CBC News*. "They look very Near Eastern and have almost zero sub-Saharan African ancestry." The study revealed that the African influence on Egyptians is relatively recent, entering into the gene pool after Roman times.

These new findings fit in with the **Dynastic Race Theory** of Flinders Petrie, lately espoused by archaeologist David Rohl. Rohl's theory is that the ancient Egyptians arrived over sea

from Mesopotamia, conquered the Nile Valley, and established the first Egyptian dynasties. This is in direct contradiction to the conventional theory that the first Egyptian rulers and much of the population arrived by a land route from Africa.

Rohl based this theory, which he explained in his book *Legend – The Genesis of Civilisation,* on the Biblical account of Ham, the son of Noah. According to Rohl's theory, Ham and his people moved from Mesopotamia to settle in Egypt after the flood. Rohl explains that this is the basis for Horus, one of the most significant Egyptian deities, who was, in fact, Ham. The name 'Horus' means "the distant one", implying that he came from far away.

To confirm his theory, Rohl led an expedition in 1988 into Wadi Hammamat, a dry river bed in Egypt's Eastern Desert that is the main desert route from the Nile to the Red Sea. Rohl studied ancient wall carvings and drawings depicting boats that had been discovered fifty years earlier by archaeologist Hans Winkler. Over 100 of these carvings depicted long boats with as many as 70 oarsmen.

These images conformed to Rohl's theory that a sudden period of cultural and technological development during the First Dynasty in Egypt was the result of an influx of Mesopotamian elite who arrived in Egypt by sailing around the coastline of the Arabian Peninsula into the Red Sea and dragging their boats across the desert to the Nile.

Patterns of trade in third-millennium BC Mesopotamia and Iran

T. F. Potts

Downloaded by [University of Alabama at Tuscaloosa] at 00:14 30 March 2015

The past twenty-five years have witnessed a series of discoveries on the eastern fringes of the Near East from Turkmenia and Afghanistan in the north to the Arabian/Persian Gulf in the south, which have revolutionized previous views on the origin and development of early civilization in these regions. Excavations during the 1960s and 1970s at late fourth–third-millennium sites across Iran (notably Godin Tepe, Tal-i Iblis, Tal-i Malyan, Tepe Yahya, Shahdad and Shahr-i Sokhta) brought to light urban centres of a previously unsuspected size, richness and technological sophistication, demonstrating that the conventional Childean picture of southern Mesopotamia and the Indus valley as isolated poles of early urbanism separated by a cultural backwoods in the intervening highlands was no longer tenable. With the closure of Iran to foreign expeditions in 1979, a number of archaeological teams moved south to the Arabian side of the Gulf, building on the pioneering work of the Danes on Bahrain and Umm an-Nar islands. The ensuing excavations, from Failaka island to the Oman peninsula, gradually made possible the definition of a sequence of local cultures and allowed archaeologists to document the crucial economic role which this maritime corridor was known from textual sources to have played, both as a source of metals and stones and as an intermediary in trade between Mesopotamia and the Indus.

Meanwhile, Soviet archaeologists working at Altyn-depe, Namazga-depe and other sites in southern Turkmenia and adjacent Margiana were revealing Central Asian cultures with many of the features of complex society in Mesopotamia and the Indus (Masson and Sarianidi 1972). The 'Namazga civilization', as the Turkmenian complex became known, was initially assumed to have been distantly derived from these 'primary' riverine civilizations, but subsequent radiocarbon datings led to a higher chronology which brings the development of Central Asian urbanism more in line with the early cities of Sumer, the Indus and Iran while also emphasizing its achievement as essentially different and independent (Kohl in Kohl (ed.) 1981; Kohl 1984). No less surprising were the results of recent tomb robbing in southern Bactria (northern Afghanistan), which brought to light a culture closely related to those of Turkmenia and Margiana dating to the late third and early second millennia, notable especially for its elaborate metalwork and stone carvings (Pottier 1984; Sarianidi 1986; Amiet 1986; Ligabue and Salvatori (eds) n.d.). Unfortunately, torn from context in illicit excavations, these Afghan finds have become the

World Archaeology Volume 24 No. 3 Ancient Trade: New Perspectives

'Luristan bronzes' of the 1980s, assigned a place in space and time largely on the basis of dealers' hearsay. Finally, the local background to the Harappan civilization of the Indus – a much longer sequence than previously realized – has been greatly expanded and clarified by recent French excavations at Mehrgarh near Quetta and at other sites in Pakistan (Jarrige 1981; Jarrige et al. 1988).

This vastly expanded data base has given rise to radical reassessments of the development of urban culture in Iran and Turan, as the eastern periphery of the Near East has been called (Tosi 1982; cf. Kohl 1984a; Lamberg-Karlovsky 1986). Recent reconstructions now give prominence to the long pre-urban development that can be traced in Iran and the Kopet Dagh piedmont of Turkmenia, and emphasize the distinctive character of the urban cultures which evolved in these and adjacent regions in the third millennium, setting them apart from their counterparts in Mesopotamia and the Indus.

One of the most striking features to emerge has been the extent of trade and other cultural contact between the early societies of southern Turkmenia, Bactria, the Indus, Iran and the Arabian Gulf. Proto-Elamite texts and other distinctive bureaucratic records of around 3000 BC, first encountered in large numbers at Susa, can now be traced as far east as Seistan, showing that the culture on Sumer's eastern border itself extended to, or maintained direct links with, the fringe of the Proto-Harappan world. Likewise in the mid- and late third millennium, metalwork, stonework and glyptic in distinctive 'Trans-Elamite' and 'Bactrian' styles occurs at widely separated sites from Bactria to Baluchistan and even Susa, where decorated metalwork long assumed to be of local manufacture must now be fitted into this broad network of exchange and diffusion reaching over 1,000km to the north-east (Pottier 1984; Tallon 1987).

The closure of Iran to foreign expeditions brought a number of very fruitful research projects to an abrupt halt but has also provided an opportunity to assess the significance of what was quickly becoming an overabundance of new and novel material. Using the newer stratigraphical sequences it has been possible over the past twenty years to reassess material from the older excavations at Susa, Tepe Sialk and Tepe Hissar and thereby to establish a broad cultural and chronological context in which the increasing quantities of 'prestige' metalwork and stonework from illicit excavations may be placed. A recurrent theme of this research, culminating in P. Amiet's recent synthesis *L'âge des échanges inter-iraniens 3500–1700 avant J.-C.* (1986), has been the circulation of materials and goods within Greater Iran and the cultural cross-currents which flowed in their wake. It is to these that we now turn.

Late Uruk and Proto-Elamite trade

Evidence of an early literate culture on the eastern border of Sumer first came to light almost a century ago in the French excavations at Susa (summarized in Amiet 1986). The primitive nature of the early excavation and recording techniques at Susa (usually consisting of simply measuring absolute levels below the variable top of the mound) prevented the establishment of a reliable stratigraphy and hindered appreciation of the vacillating Mesopotamian and Iranian orientation of Susa's material culture. This pattern – what Amiet (1979) has called Susa's 'alternance and duality' – was elucidated as far as

existing evidence allowed by Le Breton in 1957, but could not be defined on a sound stratigraphical basis until the renewed excavations under Perrot and others in the late 1960s and 1970s (summaries in *Paléorient* 4, 1978; Carter 1984; Amiet 1986; 1988a). These confirmed Le Breton's observation that Susiana had been a virtual extension of Sumerian culture throughout most of the fourth millennium (Late Uruk/Susa II), the period which witnessed the rise of full-scale urbanism in southern Mesopotamia. Administrative devices in particular, identical to those of contemporary Uruk, constitute important evidence of shared organizational practices, including clay counters or 'tokens' representing agricultu-

Downloaded by [University of Alabama at Tuscaloosa] at 00:14 30 March 2015

ral commodities, bullae (clay envelopes for containing tokens), clay sealings from doors, jars, bales, etc., and 'numerical' tablets (i.e. tablets with impressed numerical signs but no pictographs), all except the tokens typically bearing the impressions of cylinder seals used to identify the supervising authority and deter pilfering (Fig. 2: 1–4, 9–11). After a stratigraphic break of uncertain duration (Canal 1978; Le Brun 1978), the Susa III period (= Jemdet Nasr to Early Dynastic II in Mesopotamia) saw the appearance of tablets bearing the Proto-Elamite script (Fig. 2: 16–17) – the earliest Iranian writing which was almost certainly inspired by, though it shares few direct links with, contemporary Sumerian cuneiform – together with new architectural elements and ceramic and glyptic assemblages (Fig. 2: 12–15, 18–19, 21) which no longer relate to Sumer but rather look eastwards to highland Iran, in particular to Tal-i Malyan (site of the later Elamite capital of Anshan) in Fars.

The discovery in the 1930s of a similar assemblage, including numerical and Proto-Elamite tablets, lowland-type ceramics and glyptic, at Tepe Sialk (Ghirshman 1938–9; Amiet 1985) remained for many years an isolated testament to the penetration of this Sumerian/Susian culture onto the Iranian plateau, which the excavator R. Ghirshman attributed to the lowlanders' desire to exploit the rich nearby copper deposits of Anarak. In subsequent decades, however, further concentrations of Uruk/Jemdet Nasr-related material, some clearly representing intrusive colonies or outposts, were discovered widely scattered around the highland periphery of Mesopotamia on the Iranian plateau (Godin Tepe, Tal-i Iblis and Tepe Yahya (Fig. 2: 18–21)) and along the upper reaches of the Tigris and Euphrates Rivers in northern Iraq and Syro-Anatolia (Fig. 2: 1, 3, 4; evidence reviewed in Algaze 1989; J. Oates this volume), a phenomenon unmatched in the archaeological record of earlier times or indeed in the historical Sumero-Akkadian period. Recent reports of further Uruk-related material from the Nile Delta at Buto (clay cones from wall mosaics etc.) suggest that early contacts with Egypt too probably fit into this broader pattern of Mesopotamian cultural (and economic?) expansion during the late fourth millennium (Moorey 1990).

The Uruk-related sites vary significantly in size and in the range of lowland-type-artefacts and architectural features present, suggesting a hierarchy of settlement types from distant trade partners and outposts to full-scale colonies (Algaze 1989). The political dimension of this phenomenon can now be little more than speculation but its economic effects are traceable in the archaeological record, and these suggest that the Uruk expansion was at least partly motivated by the desire to channel raw materials – especially metals, stones and probably also timber – from the surrounding highlands into the Sumerians' expanding urban agglomerations. The wide variety of exotic stones – notably coloured marbles, chalcedonies, agates, schists and steatite – which are now found in sacred and burial contexts at Uruk (Heinrich 1936; Limper 1988; T. F. Potts in press (2)) provide a gauge of Uruk's broadening economic horizons. The locations of many of the Uruk outposts on major watercourses – the Tigris, Euphrates and their tributaries – underlines the strategy of establishing a Sumerian presence along the major arteries of bulk transportation.

The Uruk network of trade satellites seems to have collapsed at the end of the Late Uruk (Eanna IV) period around 3200 BC. The Sumerians of the succeeding Jemdet Nasr and Early Dynastic periods, however, were not deprived of foreign goods by this disruption, if

Downloaded by [University of Alabama at Tuscaloosa] at 00:14 30 March 2015

such it was. A considerable range of metals and stones – albeit less extensive than before – continued to be imported, as the archaeological and, later, textual sources attest. What seems to have changed are the mechanisms of trade and, in particular, the extent of direct Sumerian involvement in the extraction and procurement processes.

The fall of the Late Uruk network was followed closely (perhaps with some overlap?) by the establishment of a similar and even more widespread network of exchange. This time, however, it had a more eastern focus which served a different culture – that of the Proto-Elamites – and indeed excluded Mesopotamia altogether. According to the generally accepted chronology (which admittedly leaves considerable scope for adjustment), the old and new networks overlapped only in Susiana and perhaps at Sialk (Amiet 1985). Susa, at the junction of the two worlds, provides the clearest chronicle of the changeover from the Sumerian regime (Susa II) to that of the Proto-Elamites (Susa III), for whom this lowland city was now their westernmost outpost (Fig. 2). Other sites which have produced distinctive Proto-Elamite artefacts (pottery, glyptic, tablets, bullae, sealings, etc.) include Tal-i Ghazir and Chogha Mish in Khuzistan; and Tepe Sialk (IV_2), Tepe Yahya (IVC_{1-2}), Godin Tepe (V), Shahr-i Sokhta (I) and Tepe Hissar (II) (one possible Proto-Elamite tablet) on the Iranian plateau (summaries in Carter 1984; Amiet 1986).

The Proto-Elamite tablets and other bureaucratic devices commonly recovered from these sites seem to relate to the accounting of local agricultural produce rather than long-distance trade (Lamberg-Karlovsky 1986: 208–11; Damerow and Englund 1989: 61–4). Yet their appearance over such a broad geographical expanse represents an unprecedented diffusion of highly specific bureaucratic practices – and the movement of people familiar with this technology – far beyond its original homeland, whether this was in Fars (Malyan) or in Susiana. As in Late Uruk Sumer, the political developments underlying this phenomenon and its relationship to the earlier Uruk colonies are now very difficult to divine, but it is again plausible to suppose that a primary motivation for what must have been a major logistical undertaking was the need to distribute the valuable natural resources of the Iranian plateau within the Proto-Elamite realm. It is often assumed that the Proto-Elamites also supplied highland commodities to Sumer, filling the gap left by the collapse of the Late Uruk colonies. At least as regards copper, this may be supported by trace element analyses of Early Dynastic I metalwork from the Hamrin basin to the north-east of Baghdad, which suggest the use of the same Anarak ores which had long been used at Susa and in highland Iran (see below). The Gulf too may already have been drawn upon for its extensive copper deposits in Oman, as is suggested by the discovery of Sumerian pottery of Jemdet Nasr to Early Dynastic II date in Omani burials (D. T. Potts 1986a), and by Archaic texts from Uruk mentioning 'Dilmun(-type?) copper (objects?)' and 'Dilmun(-type?) axes' (Englund 1983: 35), though the identification of this toponym as the Dilmun of later times has been challenged (Michalowski 1988: 100f.; Glassner in press).

Patterns of trade in the mid- to late third millennium BC

Evidence for the traffic of goods between mid/late third-millennium Mesopotamia and

Downloaded by [University of Alabama at Tuscaloosa] at 00:14 30 March 2015

Iran comes principally from raw materials; artefacts of foreign manufacture are relatively rare, although account must always be taken of recycling and other factors which have distorted the archaeological record.

(i) Stones and stonework

Aside from limestone and its light-coloured derivatives calcite and gypsum, which are available from outcrops in western Sumer and along the Tigris and Euphrates rivers north of Baghdad (T. F. Potts 1989: 123, n. 2), southern Mesopotamia is largely devoid of stones. The darker more durable 'common stones' used in Sumer for sculpture, cylinder seals, vessels, doorsockets, sculpture and so on – principally diorite, dolerite, schist, serpentine, steatite/chlorite and olivine-gabbro – all had to be imported from abroad. Many of these materials are widely available in the broad mountainous arc surrounding Mesopotamia from Anatolia in the north-west along the Zagros mountains to Kerman and across the Gulf to Oman in the south-east. Establishing a more precise origin for the stones used in Mesopotamia, however, is very difficult in the absence of textual evidence specifying sources. Source provenance analysis through mineralogical 'fingerprinting' has been undertaken only for steatite/chlorite, from which the Iranians carved plain and decorated vessels which were widely circulated throughout the Near East (Kohl 1975). This has revealed a variety of stone profiles, none of which can yet be definitively located, and which has therefore proven of limited use in identifying the origins of vessels from sites in Mesopotamia (Kohl et al. 1979).

The vast majority of Early Dynastic votive statuary and other stonework recovered from

Plate 1 Early Dynastic light stone statuettes from Khafajeh, c. 2500 BC.

Plate 2 Akkadian dark stone stele found at Susa, Iran, c. 2300 BC.

Downloaded by [University of Alabama at Tuscaloosa] at 00:14 30 March 2015

sacral contexts in Sumer and Akkad as well as related sites in Syria (Mari, Khuera) and at Susa (Amiet 1976a) was carved from locally available light-coloured limestones and calcites (Plate 1). The hard, dark igneous and metamorphic stones which were particularly prized for their lustrous effect when polished began to be used for sculpture on a regular basis only in the Akkadian period. Sargon's 'diorite' stele from Susa (Amiet 1976: no.1) evinces a predilection for this and similar exotic materials which was shared by later Akkadian and Post-Akkadian rulers (Plate 2), most famously by Gudea, ensi of Lagash, c. 2100 BC (Johansen 1978). These heavy, dark diorites, dolerites and olivine-gabbros clearly possessed a prestige value which made them particularly appropriate for temple dedications and other royal monuments (T. F. Potts 1989: 143f).

Old Akkadian royal inscriptions on statue dedications (and Old Babylonian copies of other lost monuments from Nippur) for the first time furnish direct evidence of where these stones were obtained. Manishtushu (c. 2269–2255 BC), Sargon's son and second successor, relates how, after defeating the Elamites of Anshan (Tal-i Malyan) and Sherihum, he 'crossed the Lower Sea (Arabian Gulf)' and 'mined their dark stones', which he then shipped back to Agade and made into statues (Kienast and Gelb 1990: Manishtushu 1, C1). Manishtushu's successor Naram-Sin (c. 2254–2218 BC) and the later Sumerian ruler Gudea likewise relate how they mined stones in the Gulf, and their origin is now explicitly given as Magan, a region firmly identified with modern Oman (ibid.: Naram-Sin 3; Gudea Statue A, ii: 6–iii: 3 (Pettinato 1972: 137, n.818); cf. D. T. Potts

1990: 133–49). The material of the Akkadian statues – called **na$_4$ esi** in their inscriptions – has been shown by mineralogical analysis to be olivine-gabbro rather than diorite, the previous visual identification (Heimpel 1982). Such gabbros are available in Oman (i.e. Magan) but occur also in Iran; indeed, Manishtushu's inscription associates the source of esi-stone with mines of 'silver/precious metal (**kù**)', which is so far reliably reported only on the Iranian side of the Gulf (Moorey 1985: 111), although such negative evidence cannot be regarded as decisive.

Of finished stonework, vessels provide the only substantial evidence of eastern imports into Mesopotamia. Large numbers of vessels in a variety of hard, dark igneous and altered igneous stones, have been recovered widely in Sumer-Akkad from burials of the Jemdet Nasr to Early Dynastic II periods, notably at Ur, Kish, Girsu (Tello), Shuruppak (Fara), Abu Salabikh and Khafajeh (Vértesalji and Kolbus 1985; T. F. Potts in press (1)). The large numbers in which they are attested, many from otherwise quite humble burials, suggests a context of general availability which was probably supplied in large part by trade. Iran is the nearest and most likely source, although a sub-conical bowl from Tepe Hissar (Schmidt 1933: 423, pl. CXXXIX: H391; cf. Woolley 1955: pl. 35: U19241; Watelin 1934: pl. XXII lower) is so far the only close typological parallel which provides a hint as to their possible area of manufacture.

From the Early Dynastic III period onwards, dark stone vessels tend to be replaced in tombs (and increasingly also in religious contexts) by vessels of a distinctive banded yellow-white calcite (T. F. Potts 1989: 137f). The commonest shapes are illustrated in Figure 3. The same types are also found at Susa (Amiet 1986: 127). More surprising is that close parallels for these vessels, identical both in form and type of material, occur over a wide area of highland Iran, including Shahdad, Shahr-i Sokhta and for some types also Bactria (T. F. Potts 1989: 129f., 133, n. 39, 137f). Most importantly, there is evidence of production of some of these and other forms using local calcite deposits at Shahr-i Sokhta and Mundigak (Ciarla 1979; 1981; Tosi 1984).

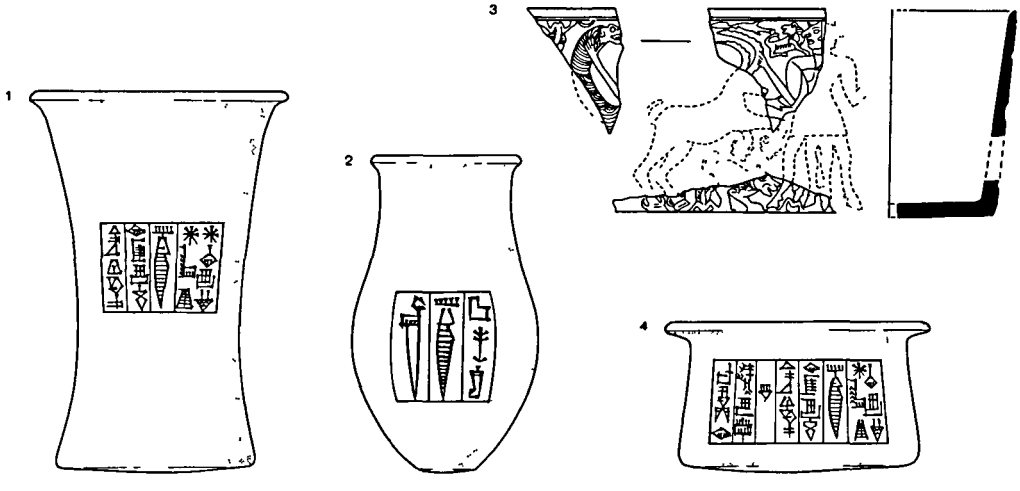

Figure 3 Booty vessels of Rimush (2–3) and Naram-Sin (1, 4) from Elam and Parahshum (2–3) and Magan (4, ?1). 1–2, 4 calcite; 3 steatite/chlorite. Found at ?Drehem (1), Girsu (2) and Ur (3) (4 unprovenanced). Not to scale.

Downloaded by [University of Alabama at Tuscaloosa] at 00:14 30 March 2015

That the Mesopotamian examples did indeed come from the east is confirmed by the Akkadian inscriptions which some of them bear celebrating the conquests of eastern lands and sometimes describing the vessels as booty from those campaigns (Fig. 3; T. F. Potts 1989). Inscriptions of Rimush (c. 2278–2270 BC), Sargon's son and successor, describe the vessels of these types as 'booty of Elam' taken in a campaign which, as Rimush relates elsewhere (Gelb and Kienast 1991: Rimush C6), was fought 'in the midst of Parahshum', an important highland Iranian state of uncertain location (Steinkeller 1982; 1989 [Kerman]; Vallat 1985 [Baluchistan]). Naram-Sin dedicated similar pieces (and one Omani chlorite vessel of the *série récente*) 'from the booty of Magan' (Fig. 3:4). From archaeological evidence it is clear that vessels of these kinds, manufactured on the Iranian plateau and Oman, were widely exchanged within and between these regions. Iranian calcite types are found along the Arabian littoral and vessels of the Omani *série récente* have occasionally been recovered from highland Iran (T. F. Potts 1989: nn. 41, 48). Captured among the spoils of Elam, Parahshum and Magan by conquering Akkadian kings, they were taken back to Agade and dedicated as offerings to the gods.

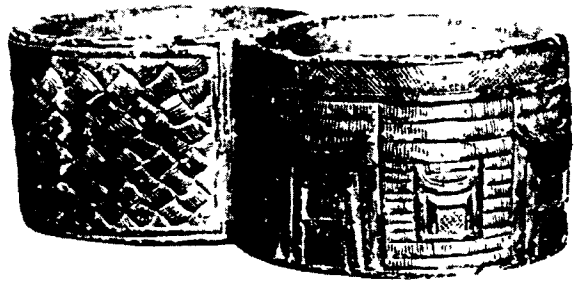

Plate 3 Steatite/chlorite vessel of the *série ancienne* from Susa, late third millennium BC.

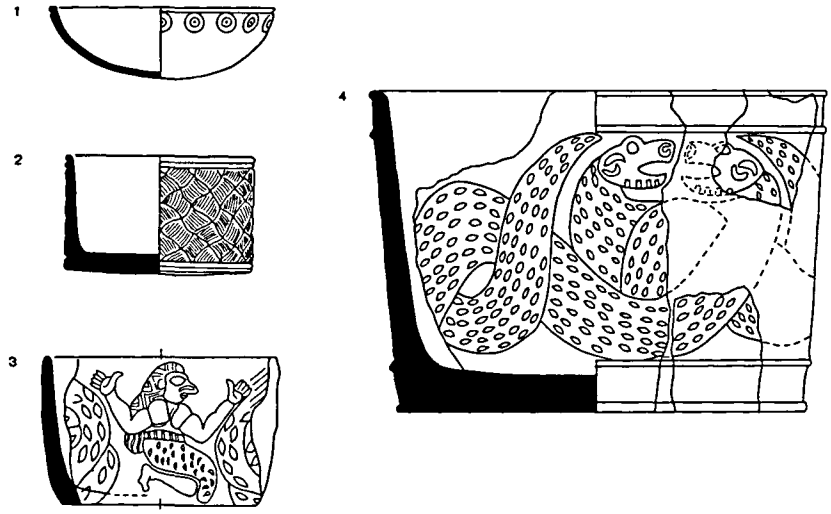

Figure 4 Steatite/chlorite vessels of the *série ancienne* (2–4) and *série récente* (1) from Susa (1–2) and Tarut Island (3–4). Scale 1:4.

Downloaded by [University of Alabama at Tuscaloosa] at 00:14 30 March 2015

Among the vessels inscribed 'Rimush, king of Kish, conqueror of Elam and Parahshum', but not explicitly described as booty from that campaign, are two fragments of steatite-chlorite bowls decorated in low relief with figurative designs (Fig. 3:3; T. F. Potts 1989: table 1, C1a, C2a). Such vessels – known as the *série ancienne* (Miroschedji 1973) or Intercultural Style (Kohl 1975; 1979) – have been widely reported across the Near East from Mari in the west to the Indus Valley in the east, with heavy concentrations (mostly Early Dynastic III-Akkadian) in Mesopotamia (Plate 3; Fig. 4: 2–4; Kohl 1975; 1979), Tarut Island in the Gulf (Zarins 1978) and at Tepe Yahya in Iran (Lamberg-Karlovsky 1988). Stylistic judgements that these vessels are non-Sumerian were confirmed in the late 1960s and 1970s by the discovery of manufacturing debris from a mid–late third millennium workshop at Tepe Yahya (Kohl 1975). Rimush's inscriptions make it highly likely that the vessels of this type recovered from Mesopotamia, including the many more uninscribed examples, came there (like the calcite types) as booty from the east.

Among Naram-Sin's vessels from the 'booty of Magan' is one example of a second steatite/chlorite series – the *série récente* (Fig. 4: 1; Miroschedji 1973) – characterized by simple geometrical designs, especially concentric dotted circles (T. F. Potts 1989: 133f., fig. 10; D. T. Potts 1990: 140). Excavations in the Gulf have established that this series, which dates from the mid-Akkadian period to the early second millennium, was produced in Oman (Kroll in Weisgerber 1981: 212–14, Abb. 46, 47). Besides booty, other examples seem to have arrived in Sumer with merchants engaged in the Gulf trade between southern Mesopotamia, Bahrain and Magan (e.g. Amiet 1986: fig. 88; Miroschedji 1973: 28 n. 116). The small flasks which contained unguents and scents may represent genuine articles of trade (Amiet 1986: 164; Miroschedji 1973: 33), but the common hemispherical bowls were probably incidental acquisitions, picked up as momentos by merchants engaged in the economically primary trade in copper and other raw materials. Tarut Island seems to have been a major consumer and probably also an entrepôt for the distribution of both the *série ancienne* and the *série récente* along the Gulf (Zarins 1978).

(ii) Semi-precious stones

Along with gold, the semi-precious stones carnelian and lapis lazuli were the most highly prized and widely exploited materials for jewellery and luxury inlay work in third-millennium Mesopotamia. Unlike lapis, carnelian is widespread in Iran and on the periphery of the Indus region, the largest nodules being found in Gujarat (Tosi 1976–80: 448f). Evidence of local working in Mesopotamia has been discovered at Larsa (Chevalier et al. 1982) and Uruk (Aue 1985), although imported heat-treated ('etched') beads of Harappan manufacture are also found (Reade 1979). Third-millennium and later cuneiform documents confirm that the Sumerians obtained carnelian from the east, especially Meluhha, i.e. the region of the Harappan civilization (e.g. Reiner 1956: 133; Attinger 1984: 13; Jacobsen 1987: 408, 437). From Akkadian times on, when sea-borne commerce between the Indus and Sumer is amply attested, this trade may be assumed to have been transacted by boat. In the earlier third millennium, however, the possibility of a more significant overland trade in this low-volume commodity must also be considered.

The source and trade routes of lapis lazuli have been much discussed in recent years. Since Herrmann's seminal study (1968), most discussions have accepted her conditional

Downloaded by [University of Alabama at Tuscaloosa] at 00:14 30 March 2015

proposition that the nearest source of Mesopotamian lapis was Badakhshan in Afghanistan. That this lapis was indeed mined in the third millennium has been corroborated by the discovery of a Harappan lapis procuring colony north of the Badakhshan mines at Shortugai on the Oxus river (Francfort and Pottier 1978).

Herrmann posited an overland Iranian route between Badakhshan and Mesopotamia following the 'Great Khorasan Road' across northern Iran via Tepe Hissar and along the Diyala river to Akkad. The discovery of lapis working debris at Shahr-i Sokhta later raised the possibility of a southern route along the Helmand River and thence through Seistan, Kerman and Fars debouching onto the lowlands near Susa (Tosi 1974; 1984). There can be no doubt that lapis was indeed transported along these or similar routes within Iran, since it was consumed in substantial quantities not only at Shahr-i Sokhta but also at Shahdad, Tepe Hissar and elsewhere. It is an open question, however, whether this was a side effect of overland trade directed towards Mesopotamia or evidence of a primarily Iranian network satisfying local demand.

In the first place, aside from the tendentious narrative poem *Enmerkar and the Lord of Aratta* (S. Cohen 1973; Jacobsen 1987: 275–319; Michalowski 1986: 133), which describes lapis being sent from Aratta to Uruk, the Mesopotamian textual evidence suggests that lapis was acquired principally from Meluhha (e.g. Gudea Cyl. B xiv: 13; M. Cohen 1975; Pettinato 1972: 78, 135), with which trade was conducted by boat along the Gulf. Contemporary documents from the second half of the third millennium give no indication of overland trade in stones with Iran. Sea trade with the Indus, on the other hand would tie in well with the evidence for Harappan procurement at Shortugai (although a problem remains in the rarity of lapis on mature Indus sites; Ratnagar 1981: 132–5).

There are occasional references from the Achaemenid period to modern times to sources of lapis in Iranian Mazanderan, Kerman and Azerbaijan (Herrmann 1968: 27f.). While none of these has been confirmed by modern reconnaissance, neither can they be dismissed. An indication of how small outcrops may easily escape attention is provided by the recent discovery of lapis near Quetta on the Iran–Pakistan border (Berthoud et al. 1982: 41 n. 21). A further problem is that there are other materials (azurite, sodalite, etc.) virtually indistinguishable from lapis by eye which may exist in Iran and may have been exploited in antiquity alongside lapis.

(iii) Metals

Lacking any local supplies, Sumer was entirely dependent on external sources for the metals which were an essential requirement of urban life, providing the raw material for tools, weapons and utensils, as well as artistic pursuits such as sculpture and jewellery. Evidence for the origin of Mesopotamia's metals comes from textual references (royal inscriptions, literary compositions, lexical lists and administrative records) and source-provenance pinpointing through trace element analysis. A recent programme of analyses on a wide range of Iranian and Mesopotamian metalwork in the Louvre provides a much improved basis for discussion (Berthoud et al. 1982; Tallon 1987), although its conclusions need to be regarded as provisional in view of methodological and analytical questions which have been raised (Seeliger and Pernicka 1985: 643 n. 74; Hauptmann et al. 1988: 34).

Downloaded by [University of Alabama at Tuscaloosa] at 00:14 30 March 2015

As would be expected, for copper the settlements of highland Iran seem to have depended on the major plateau mines of Anarak-Talmessi and, less extensively, Bardsir-Sheikh Ali (Berthoud et al. 1982; Malfoy and Menu 1987). Susa too drew heavily on these supplies throughout the late fourth to mid-third millennium (Susa I–III periods). Less evidence is available for Mesopotamia, but the Early Dynastic I sites of the Hamrin in northern Akkad likewise seem to have received copper from Anarak (Berthoud et al. 1982: 43; Amiet 1986: 35).

Both Susa and Sumer show a shift from Iranian to Omani copper (characterized by higher iron content) in the second quarter of the third millennium (Amiet 1986: 126; Malfoy and Menu 1987: 364f.; Cleuziou 1986: 145; Moorey 1985: 12, 14). In Early Dynastic III and later periods, down to Old Babylonian times, there can be no doubt but that much of Sumer's copper came from Oman, for lexical and economic texts are explicit in citing Magan as the source of the copper regularly acquired by Gulf merchants, Dilmun acting as the major entrepôt.

The usual alloying material used for hardening copper in Mesopotamia and Iran at this time was arsenic, for which the principal Near Eastern source was Anarak. (Other reports of usable arsenic mineralizations, e.g. in Armenia (Muhly 1976: 90), remain unconfirmed.) Early arsenic-rich coppers of the fifth and fourth millennia were no doubt natural alloys resulting from the use of Anarak copper ores, which typically contain up to 1 per cent arsenic. However, higher levels of between 1 per cent and 3 per cent, which become common in the Early Dynastic III and Akkadian periods, almost certainly indicate some degree of intentional alloying. There is no textual evidence for how the additive may have been traded (no Sumerian or Akkadian word for arsenic has been identified), whether overland directly to Susa and Mesopotamia, or south to the Gulf and thence by boat to Sumer. The presence of arsenical coppers in Oman may indicate some movement along the latter route.

Tin bronze, although occasionally attested from the late fourth millennium, does not appear as a consistent feature of Mesopotamian metallurgy until the Early Dynastic III period, and only replaces arsenical copper as the staple alloy around the turn of the second millennium. (The most abundant analytical evidence comes from Susa, which may be used as an approximate guide to Sumer: definitively intentional bronzes of over 5 per cent tin are still very rare in the Akkadian period (Susa IVB), and represent only 10 per cent of the tested sample in Ur III (Susa VA); they become widespread only in the early second millennium (Susa VB), when 48 per cent of the sample contains over 5 per cent tin (Malfoy and Menu 1987: 333, 361, table D)).

The source of Near Eastern tin has long been one of the outstanding problems of ancient metallurgy. Mesopotamian texts indicate that, like carnelian and lapis, tin came primarily from the east, but the evidence is patchy and inconclusive as regards specific locations. The more reliable documents – historical and administrative texts – cite Meluhha (Gudea Cyl. B xiv: 13) and Dilmun (Pettinato 1983: 77 (Ebla)), the latter presumably an entrepôt. Transactions involving tin (of unspecified origin) were made at Susa (Scheil 1913: no. 35) and tin was issued at Lagash to the ensi of the Elamite border town Urua (Lambert 1953: 65). This suggests that tin may have changed hands as part of the Gulf trade, although it is not cited as such among the surviving trade texts from Ur (Oppenheim 1954; Leemans 1960). Literary and lexical texts also cite Aratta (S. Cohen 1973: ll. 17–19, 415),

Downloaded by [University of Alabama at Tuscaloosa] at 00:14 30 March 2015

Magan (M. Cohen 1975: 28 l. 144), beyond Mt Ebih (Hamrin) (Muhly 1973: 288 n. 341; cf. Heimpel 1982: 67 n. 21), Zarshur (Leemans 1960: 7 l. 25), [Za]rha and BAR-gungunnu (Reiner 1956; Leemans 1960: 8 ll. 23f.) while royal inscriptions mention tin as booty from Zabshali/Shimashki (Sollberger and Kupper 1971: IIIA4e) and probably Anshan (Davidović 1984: 186f., 200). In the second millennium, tin was traded by caravan from Ashur to Cappadocia, and was exchanged in transactions (though from which sources is unclear) at Susa and Shemsharra (Larsen 1976: 87–9; 1982: 40; Leemans 1960: 123f.; Muhly 1973: 292ff.).

The first confirmed report of a plausible tin source has recently come from western Afghanistan (Berthoud and Cleuziou 1983: 24ff.). Evidence of 'protohistorical' workings near the Misgaran mines (Berthoud et al. 1982: 49) lends support to the view that Afghan tin was indeed exploited in antiquity, perhaps as early as the third millennium. Evidence of an alternative source in the Bolgardagh region of the Taurus mountains in Turkey (Yener n.d.; Yener and Özbal 1987) is accumulating (but cf. Muhly et al. 1991). On the other hand, earlier reports of usable tin deposits in Iran, the Caucasus and Turkey remain unconfirmed (Muhly 1973: 248–61; 1985; Franklin et al. 1978; de Jesus 1980: 53ff.; Berthoud et al. 1982: 49). The dearth of tin bronze in highland Iran (Berthoud et al. 1982: table C; Moorey 1982: 87f.; Tallon 1987: 335; Beyer 1989: 118) strongly suggests that any Afghan tin traded with Mesopotamia travelled south through the Indus and up the Gulf by boat, rather than overland across the Iranian plateau. Such a sea route would account for the Mesopotamian tradition of tin from Meluhha, Magan and Dilmun, and for the occasional occurrence of tin bronze in Oman (Berthoud et al. 1982: 47, 50). It is also supported by the fact that the use of tin in the Indus region reaches a peak in the Harappan period (Ratnagar 1981: 83; Agrawal 1984: 164).

The precious metals silver and gold are both widespread in Iran, Anatolia and elsewhere, and were probably obtained from various sources at different times. In the second millennium, Mesopotamia obtained silver from the nearest and richest mines, those of the Taurus mountains. However, while Sargon refers to the 'silver mountain' (= Bolkardagh) near the 'Upper Sea (= Mediterranean)' (Kienast and Gelb 1990; Sargon C2: 34f.), there is no textual evidence for silver arriving from this direction in the third millennium. Rather, what indications exist again point to the east. Some documents – mainly literary and lexical texts – allude to the silver of places believed to lie in highland Iran (e.g. S. Cohen 1973: 18f., 39; Reiner 1956; Gudea Cyl. A xvi: 18f.), as well as Dilmun and Meluhha along the Gulf (M. Cohen 1975: 31, 149f.; Pettinato 1972: 123). On the other hand, the receipt of silver in transactions along the Mesopotamian-Iranian border at Der (modern Badra), Urua (eastern Khuzistan?) and Elam (here probably Susa) (Lambert 1953: 61 (DP 513), 63 (Nik 292); Michalowski 1978: 48) reflects its use as a medium of exchange and so cannot be used to plot sources. More significantly, the Akkadian king Manishtushu relates how, after conquering Anshan, he crossed the Lower Sea where he engaged the enemy as far as the 'silver mines (*hu-rí kù*)' (Kienast and Gelb 1990: Manishtushu C1: 29). This itinerary suggests Oman (Magan) but since silver is not attested in substantial deposits there (Moorey 1985: 111; cf. Tosi 1975: 202) the possibility must be considered of a source in southern Iran. (A land 'across the (Lower) Sea' is not necessarily in Arabia; in Assyrian times this expression could be used to refer to Iran and Glassner (1989: 186) has argued that it should be understood in this way also in texts of the

Downloaded by [University of Alabama at Tuscaloosa] at 00:14 30 March 2015

Akkadian period). Wherever it lay, Manishtushu's silver mine was accessible by boat and its produce could therefore have been traded by the sea-borne Gulf merchants.

Gold too seems to have come primarily from the east. Lexical and literary documents mention a number of gold sources which can be placed with varying degrees of confidence in Iran (Aratta, [H]arali, Hublul, Zarshashum, Hahum), as well as Meluhha (S. Cohen 1973: ll. 39, 124, 618f.; Attinger 1984: 13; M. Cohen 1975: 31; Pettinato 1972: 79 n. 235, 154–6; Gudea Statue B vi: 33–5). Of these, only Meluhha is confirmed by an 'historical' source, the inscriptions of Gudea (Statue B vi: 38–40, Cylinder A xvi: 19f. (Pettinato 1972: 146, 166ff.; Jacobsen 1987: 408)). References to gold taken as booty from Shimashki, Elam, Parahshum, Susa, Awan and Adamdun are unfortunately no guide to original sources (Kutscher 1989: BT4 v: 5–8, vi: 19–33, ix: 12–20; Kienast and Gelb 1990: Rimush C6: 138f.; Sollberger and Kupper 1971: IIIA5b–c; for locations see Edzard and Farber 1974: s.v; Stolper 1982; Steinkeller 1982; Vallat 1985).

Some gold may also already have come from Anatolia. Gudea cites gold from a Mt Hahum, which probably lay between Diyarbakir and Elazig (Groneberg 1980: 85f.) or in the Elbistan plain (Garelli 1963: 109). In a very damaged text the fourth king of the Ur III dynasty Shu-Sin (c. 2037–2029 BC) refers to the mining of gold and silver, apparently in the vicinity of [Mar]daman (= Mardin; Edzard and Farber 1974: 118) and Ha[bura] (= the Habur) (Kutscher 1989: BT4 vi: 1–18). Northern mines became the primary source of Mesopotamian gold in the second millennium (Moorey 1985: 73f.), although some may still have come via Dilmun (Leemans 1960: 120f.). After a promising start, trace element analysis has not so far shed much additional light on this picture (Ogden 1977; Meeks and Tite 1980).

(iv) Finished metalwork

If there is ample evidence for the flow of raw metals into Mesopotamia, finished metalwork of eastern origin is conspicuous by its absence. A number of distinctive elaborately decorated Iranian and Bactrian-related types, including axes with 'winged' butts (Fig. 5), occur widely in the Iranian highlands from Khinaman and Shahdad westwards across the plateau and onto the lowlands at Susa, but there they stop (Pottier 1984; Amiet 1986; Curtis 1988). Only a handful of pieces from southern Mesopotamia may plausibly be classed as Iranian imports, and there are none from further afield (Carter 1990; T. F. Potts in press (2)). Aside from the most simple undiagnostic utilitarian forms, metalwork of Mesopotamian type is similarly scarce in the Iranian highlands, indicating that movement from the lowlands eastwards was equally rare. Among the few suggested links are a type of gold earring (Maxwell-Hyslop 1987: 22) and a group of 'harpe-swords' (Pottier 1984: nos 23–6; cf. Collon 1986: 28f., 52), both reportedly from Bactria.

Documentary evidence presents a very different picture. Sargonic and Ur III royal inscriptions indicate that substantial quantities of metalwork were taken as booty from Elam and elsewhere in Iran, and the fact that this has not survived no doubt reflects the prevalence of remelting. Recycling alone, however, would hardly account for the dearth of Iranian metalwork in Sumer-Akkad if the irregular taking of booty had been supplemented by any substantial traffic of trade. The archaeological *argumentum ex silentio* is corroborated by a similar gap in the textual sources concerning commercial exchange.

Downloaded by [University of Alabama at Tuscaloosa] at 00:14 30 March 2015

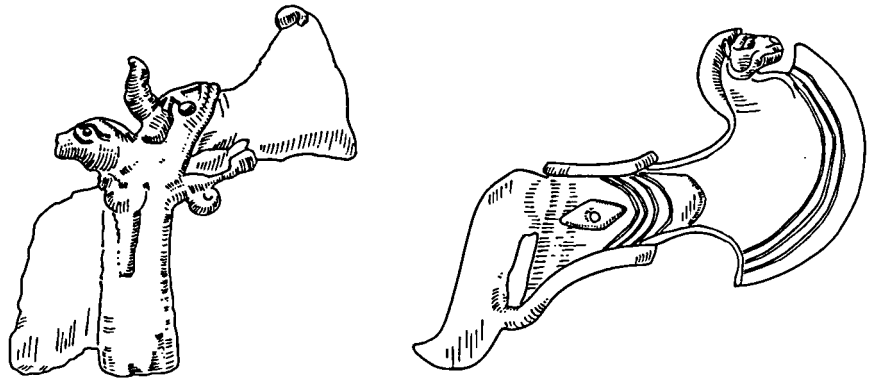

Figure 5 Iranian/Bactrian-style copper axes. Found at Susa (1); (2) unprovenanced. Not to scale.

Account texts of the later third millennium deal commonly in raw copper and other metals, but are virtually silent with regard to finished metalwork. Likewise lexical and other canonical references to metalwork of foreign origin are extremely rare (e.g. the 'Dilmun(-type) axe (?)' [**dilmun tùn**] in the Archaic metals list from Uruk (Englund 1983; Nissen 1986: 338), and a *za-hum* from Magan (Limet 1972: 14; Glassner 1989: 187)).

A large part of the explanation is no doubt logistical. Metal travels most conveniently and with least risk of damage as ingots. Unlike raw stone blocks, much of which would be wasted in working, all of the ingot could be used, and used according to local tastes and requirements.

Conclusions

Plausible evidence of overland trade (as distinct from booty taking) between Mesopotamia and Iran is surprisingly scarce – primarily the hard, dark stone vessels of Jemdet Nasr to Early Dynastic II burials, and Jemdet Nasr to Early Dynastic I (arsenical) copper from Anarak-Talmessi in Iran. For the rest – semi-precious stones like carnelian and lapis lazuli; copper, tin and gold; and exotic woods – textual evidence, as far as it goes, suggests that they arrived chiefly by sea via the Gulf, a conclusion confirmed in the case of mid- to late third millennium copper by analyses indicating the use of Omani ores. The dearth of Elamite and other highland Iranian artefacts from Mesopotamia is all the more telling in view of the Indus seals and other Harappan artefact types which occur in Sumer-Akkad (Ratnagar 1981) and at Susa (Amiet 1988).

Present evidence thus suggests an increasing dependence on sea-borne trade at the expense of overland links with Iran, hinging around the Early Dynastic III period. Hints of an even earlier start to the Gulf trade ('Dilmun copper' in Archaic Uruk texts and Jemdet Nasr to Early Dynastic II pottery in Oman) suggest that this might be less a matter of a shift to the Gulf than a falling away of the earlier (supplementary?) overland trade. Such a state

Downloaded by [University of Alabama at Tuscaloosa] at 00:14 30 March 2015

of affairs would find a ready explanation in the historical evidence of increasing Mesopotamian–Iranian hostility from Early Dynastic III on (Stolper 1984; T. F. Potts in press (2): ch. 3). From very early times, the procurement of raw materials seems to have been a complex matter involving disparate sources in various directions, the relative prominence of a particular region depending on political developments and other factors which were only partly under Mesopotamian control.

A feature which emerges with new emphasis is the importance of booty-taking as against trade in accounting for those conspicuously exotic finished products (principally stone vessels) which have been found on Mesopotamian soil. Historical inscriptions of the Akkadian and Ur III periods record large quantities of metalwork and stonework, along with various perishable items, taken as booty in campaigns against the eastern lands of Elam, Parahshum, Shimashki and Magan (T. F. Potts 1989: tables 1–2; Kienast and Gelb 1990; Rimush C6: 138–47, Manishtushu 1: 31–6, Naram-Sin 3: 37–43, Ur C2: 48–57; Pettinato 1982; Davidović 1984). It is not surprising, therefore, to find manifestly foreign stone vessels of the *série ancienne*, or calcite vases of east Iranian/Bactrian type, bearing inscriptions celebrating these victories, some explicitly labelled as booty. Nor was such booty of merely propagandistic significance. In a society where tribute and 'diplomatic gifts' were essential expressions of complex political relationships, and where temples and palaces were both the chief beneficiaries of institutional patronage and the primary repositories of stored wealth, the looting of a major highland capital was not only a political landmark but also an economic event of major importance. While the taking of booty was by nature unpredictable and could never have replaced regular trade as the basis of Mesopotamia's staple needs, neither should the economic importance of war in times of aggressive imperialism be underestimated.

This raises a point of more general interest. Trade and other modes of exchange are all forms of economic reciprocity, i.e. transactions in which each party gives and receives something to and from the other. While models which take their starting point from modern economic analogies tend to assume that this covers the field well enough, such a perspective leaves out of consideration a whole other class of phenomena: viz. non-reciprocal movements where goods flow – typically under duress – in one direction only. The principal mechanisms of this type, well documented in historical periods, are booty-taking and the extraction of tribute, where goods are taken by right of conquest or suzerainty without any *quid pro quo*.

Much attention has been devoted to the study of trade in the Near East and the ancient world generally, so that 'down-the-line trade', 'trickle trade' and various other mechanisms of reciprocal exchange form standard elements in every archaeologist's explanatory tool kit. And these have generally been the explanations of choice when artefacts of foreign material or manufacture are encountered on archaeological sites. To the extent that other options are explored, these too tend to be forms of reciprocal exchange, albeit of a less 'commercial' or market-driven kind (e.g. Renger 1984). Rarely is serious attention given to the possibility of some kind of non-reciprocal movement of goods.

Yet it is clear from historical sources that this was often a major – perhaps at times the principal – mechanism by which foreign materials and goods moved from resource-rich extraction and manufacturing areas to more powerful but resource-deficient imperial states. The Akkadian, Ur III and Neo-Assyrian empires are only the more obvious

Downloaded by [University of Alabama at Tuscaloosa] at 00:14 30 March 2015

instances in Mesopotamian history. The evidence outlined above suggests that such may have been the case to some extent also in earlier times, especially as regards finished goods.

The two explanations differ in some important respects. While trade is an essentially economic postulate, to suggest that foreign goods arrived at their place of discovery by some non-reciprocal mechanism is to imply that that region exercised military or political dominion over the source area. Furthermore, while neither is more probable than the other *a priori*, the circumstances in which political suzerainty can justifiably be postulated are narrower (or so it has generally seemed) than for trade. It is a natural assumption that most regions – whether central or peripheral, powerful or weak – engaged to some degree in trade with surrounding peoples. By contrast, to judge by historical evidence, relatively few regions were able to dominate their neighbours to the extent of being able forcibly (i.e. non-reciprocally) to extract the goods and materials they desired.

Against the very limited scale of direct Mesopotamian–Iranian overland trade must be set the evidence for a wide-ranging network of exchange within greater Iran documented by Amiet (1986). Metalwork, stone vessels and other items, many of distinctive, highly elaborate types, are found in closely analogous forms over vast distances from Bactria through Baluchistan and Kerman to Susa in south-western Iran. Contacts extended also across the Gulf to the Arabian peninsula, as is demonstrated by the occurrence of late third-millennium Omani pottery and stone vessels in Iran, and Iranian forms in Arabia. Clearly, the logistical difficulties of overland trade did not seriously inhibit exchange within the Iranian-Turanian highlands and even onto the lowlands at Susa. The failure of these types to penetrate further west into Mesopotamia is therefore doubly striking. One inhibiting factor was probably the cultural discontinuity which separated the Sumero-Akkadian lowlands from the eastern highlands, where Elamites, Parahshians and other non-Sumerian, non-Semitic peoples predominated. The more elaborately decorated highland artefacts embody a rich mythology which the Mesopotamians would have been little better equipped to appreciate than we are today.

The more immediate explanation for Mesopotamia's exclusion from the Iranian-Turanian circuit, however, is probably economic – viz. the greater speed, facility and economy of transporting substantial quantities of goods by boat as opposed to equid caravans. The raw materials which fed the Gulf trade came primarily from the Arabian side of the Gulf (Oman for copper and olivine-gabbro) and the Indus (lapis, carnelian, timber, gold, ?tin). None of the known commodities came exclusively from Iran and none of the known staging posts on this route was on the Iranian coast (unless Magan extended over both shorelines). Thus the opportunity for acquiring finished Iranian products was largely restricted to materials which had been transported overland to the Iranian coast and then shipped across the Gulf to entrepôts such as Bahrain and Tarut. Trade in finished goods along this route seems, in any case, to have been relatively limited, and was clearly dependent on the regularized exchange mechanisms structured around the economically primary trade in raw materials, especially metals. Many of the *série ancienne* and *série récente* vessels and other eastern exotica (including Gulf/Indus seals, cubic weights 'etched' carnelian beads etc.) which have been found in Sumer and at Susa were probably acquired casually, not to be traded or bartered but as curiosities to be kept as momentos or perhaps dedicated to an appropriate deity in appreciation of a safe return.

Abstract

Potts, T. F.

Patterns of trade in third-millennium BC Mesopotamia and Iran

Southern Mesopotamia's lack of most raw materials made it dependent to an unusual degree on trade and other forms of procurement from foreign lands. The appearance of wide-ranging trading networks extending far into the surrounding highlands of Anatolia and Iran may be traced in the archaeological record of the late fourth and third millennia. From the mid-third millennium, the archaeological and textual evidence combine to suggest an increasing dependence on maritime exchange along the Arabian/Persian Gulf at the expense of overland trade with Iran. Finished goods of eastern manufacture are conspicuously rare in Mesopotamia. Among those that do occur, some stone vessels are identified by their inscriptions as booty rather than objects of trade. Evidence is reviewed which suggests that such non-reciprocal mechanisms of procurement may have been more significant than has previously been recognized.

Mountain Goddesses in Ancient Thrace: The Broader Context

The ancient writers often connect the cult of Phrygian Cybele with mountains and rocky highlands. The goddess was even called Μήτηρ Ὀρεία or 'Mountain Mother', as attested in both literary sources and epigraphic evidence. However, other records give us information that similar religious ideas were not confined to Asia Minor and two female deities in ancient Thrace were also associated with mountains, similarly to Cybele. And although there is no written source testifying that these Thracian goddesses were called 'Mount Mother', some evidence might support the conclusion for their appearance as a mountain.

Most important here is the cult of the goddess Ῥησκυνθίς associated with Greek Hera, who was celebrated on the sacred mountain Ῥησκύνθιον close to the mouth of Hebros in Southeastern Thrace, as attested by Nicandrus and his scholiast[1]. This mountain goddess was worshipped together with her male companion Ζηρύνθιος (Zerynthius), called Apollo by the Greeks, and this took place in a temple located on Mount Rheskynthion[2]. The cult of Rheskynthis and Zerynthios was obviously related to the worshipping of another female deity – the goddess Ζηρυνθία known from a number of ancient literary records and identified with Hecate, Aphrodite or Rhea[3]. She was a chthonic deity who was honored with dog sacrifices that were performed in a sacred cave called Ζήρυνθον (Ζηρύνθιον, Ζήρινθον), located by the ancient authors in two different places – on Samothrace or in the opposite mainland near the mouth of Hebros[4]. Similar conflation between the names of the female deities, the sacred mountain and the cave reminds us of the information of Hesychius who explained Κύβελα like "a mountain in Phrygia, and caves and graves"[5].

3 The main sources on Zerynthia are collected in: D. Detschew, *Die thrakischen Sprachreste*, Wien, 1976², p. 184-185; *cf.* also Lycophr., *Alex.*, 72-80 Scheer; Nicandr., *Ther.*, I, 462-463 Gow-Scholfield; *Schol. in* Aristoph., *Pax*, 277-278 Koster; Nonn., *Dion.* XIII, 400 Keydell.

4 *Ibid.*

5 Hesych., *s.v. Kybela* Alberti.

The second deity in Thrace who was associated with a mountain is the goddess Γανηα known from a votive inscription on a small altar dated to the Roman Imperial period[6]. It was dedicated to the goddess by Apollonios son of Seuthes, obviously a man of Thracian origin considering his father's name[7]. It is most significant that the altar was found exactly in the region of Γάνος[8] – the famous sacred mountain in Southeastern Thrace, called Ἱερὸν ὄρος by the Greek writers and first attested by Xenophon in the beginning of the 4th century B.C.[9] In this case the goddess and the sacred mount have identical names again, which supports the conclusion for a mountain aspect of the female deity. At the same time, the important nature of the site is attested by Demosthenes[10] and Aeschines[11] who described a residence and treasury of the Odrysian kings Kotys and Kersebleptes located in Hieron Oros. And even more: in a later period Strabo[12] wrote that the local people worshiped the sacred mountain. This information probably reflects the cult of Ganea.

Actually, a couple of literary records give clear information about other mountains in ancient Thrace that were known as sacred highlands where different cult activities took place. Amongst the most famous ones is Kogaionon, a sacred mount in Northeastern Thrace where the male deity Zalmoxis was worshiped[13]. Another important mountain was Pangaion located in Southwestern Thrace, strongly related to the cult of Orpheus and the Edonian mythical king Rhesos[14]. Of special interest also is Saon (Saos, Samos, Saoke), the high mountain of Samothrace where the mysteries of the Great Gods were celebrated besides other deities that were worshiped on the island[15]. The list of mountains related to different cults in ancient Thrace

could be prolonged, but there is not any clear information that they were directly associated with female deities. So, one can only speculate that these mountains might represent aniconic images of mountain goddesses similarly to Rheskynthion and Ganos. In the context of all these written sources, very significant is the great number of Thracian sanctuaries located in mountains and rocky highlands that clearly show the sacred nature of the places[16]. Also, it is possible to suppose that the numerous tumuli of ancient Thrace might symbolize sacred mountains and if so, these burial constructions could be related to some cults of mountain goddesses besides their funerary functions[17].

Similar religious ideas in ancient Thrace should be studied in a broader context. Of course, the closest parallels might be found in the cult of the Phrygian Great Goddess Cybele, usually identified with a Mountain bearing the same name[18]. In a number of epigraphic records from Asia Minor dated to the 4th – 3rd centuries B.C. and to the Roman Imperial period the goddess was called Μήτηρ Ὀρεία[19]. Diodorus also testified that Cybele was known as 'Mountain Mother'[20] and he described a mountain called Κύβελος while the goddess was named after this mount[21]. Κυβέλοι Mountains are reported in *Orphei Argonautica*[22], besides that Herodianus described Κύβελα like a "*polis* in Phrygia and ὄρος ἱερόν"[23] and mentioned the sacred mountain of Κυβέλοι[24], too. Later on, Herodianus' information was repeated by Stephanus Byzantius[25] and Hesychius explained Cybele like "a mountain in Phrygia, and caves and graves"[26], as cited above. All these sources clearly show the mountain aspect of the goddess.

Following these ideas, some epithets of the Great Goddess in Asia Minor are also important. Strabo wrote that on a hill close to Lampsakos there was a sanctuary of Meter Theon called Τήρεια[27]. At the same time, the mountain of the goddess Tereia was located near Kyzikos, being known to Homer[28] and described again by Strabo[29]. Later on, Hesychius wrote that Tereia was a mountain in Troas[30]. Very clear evidence comes from some epigraphic records, too. Thus in numerous inscriptions Meter Theon was called Σιπυληνή[31], obviously a name that originated from Sipylos mountain, and in a similar way the Great Goddess was called with another mountain epiclesis: Δινδυμήνη[32] coming from Dindymon (Dindyma). Actually, this way of giving the goddess a name derived from different mountains in Asia Minor is well described by Strabo[33].

All these testimonia concerning the cults of mountain goddesses probably reflect some relations between ancient Phrygians and Thracians, and even may show that the origins of the Phrygian people lay in the Northern Balkans, as attested in literary records and recently confirmed in archaeological material from Gordion[34]. On the other hand, the Phrygian Μήτηρ Ὀρεία seems to influence strongly Greek literature and cult, most clearly attested in the image of goddess Rhea being called 'Mountain Mother'. A similar syncretic process could be traced back in the literary works of the late 5th century B.C. Thus Aristophanes[35] and Euripides[36] described Rhea (associated with Cybele) as Μήτηρ (Μάτηρ) Ὀρεία and in another Euripides' tragedy the goddess was called Ὀρεία Μάτηρ θεῶν[37]. In fact, the literary image of Rhea as a 'Mountain Mother' was probably created in the interaction zones of Asia Minor, where the idea had been borrowed from the

non-Greek people. A similar proposal might be supported by a scholion to Apollonius Rhodius[38], referring to a sanctuary of 'Ορεία Μήτηρ at Sangarios, which was described by the Greek logographer Xanthos from Lydia who lived in the 6th-5th centuries B.C. The literary image of the 'Mountain Mother' survived into the Roman Imperial period, as attested by Antistius[39]: 'Ορεία Μήτηρ θεῶν, and in the Orphic Hymns[40] where Rhea is described as Μήτηρ 'Ορειομανής. It is interesting that in another Orphic Hymn[41] Gaia was also considered in a similar way: Μήτηρ 'Ορέων, and in a later period Eusebius[42] called the goddess Παμμήτωρ 'Ορέων.

At the end of this paper, another epigraphic record should be mentioned. On a Late Hellenistic silver bowl from Barbara and Lawrence Fleischman Collection a brief inscription is incised: Κοτεους Μητρὸς 'Ορέας – in translation "Koteous [son/servant] of Mountain Mother"[43]. And although the provenance of the hoard is unknown, it is possible to suppose that the vessel comes either from Asia Minor or from ancient Thrace. In both cases however, this inscription is remarkable evidence for religious ideas and cults related to the mountain appearance of the goddess. A future comparison between the written sources mentioned here and the archaeological material may help to define more clearly the cult of the mountain goddesses in ancient Thrace and their relationship to other female deities worshiped in Asia Minor and Greece.

Introduction

On the 5th of May 1899 I came across three inedited Punic Steles at Mgr. Canon George Falzon's residence in Floriana.

No record has been kept of the place of their original discovery. They were acquired by the Canon's brother, the late Rev. Francis Falzon, who died in 1869.

These Steles belong to the well known Tanit series, found almost so exclusively at Carthage, that the compiler or the "*Corpus Inscriptionum Semiticarum*" considers those discovered at Hadrumetum and Utica as doubtful.

The circumstances connected with their appearance at Floriana are shrouded in complete darkness, beyond the fact that Mgr. Caruana Dingli, a nephew of the late owner, positively states having seen them at home all his life. This statement, which covers the period of more than fifty-three years, would appear to throw a side light on their origin. Fifty years ago excavations for antiquities could scarcely have been undertaken by private enterprise at Carthage, as the Steles are found either buried deep in the soil, or forming part of underground constructions. The first Tanit Stelesknown to have been discovered were dug out at Malga (Malka) in 1817. Their exportation into Europe began in 1831; but there is no evidence of its having been effected, except by known antiquarians and amateurs, or by gentlemen holding official appointments from European Governments.

Before Mr. Nathan Davis discovered in 1856-58 at Byrsa, and on the spot occupied by the temple of *Juno Cœlestis* the large collection now at the British Museum, they were extremely rare. Even subsequent discoveries and respective places of preservation are carefully traced up to the year 1864. It is therefore hard to conceive how so highly valued articles could, *at the time pointed out by Mgr. Caruana Dingli*, have found their way from Carthage into an unassuming private collection at Floriana. Certainly the present owners had no idea of their value. At a later date the Tanit tablets became at the hands of the Tunisians an object of research for trading purposes, and even local collections in the Regency were partially disposed of.

On the other hand the special worship paid in Malta to the "Great Goddess" according to the common National religion of Carthage, and the Colonial connection with the Libyan continent might be urged in support of their Maltese origin. Moreover traces of "gypsum" (plaster of Paris) have been found on the back of some of the Carthaginian series (*Cor. Inscr. Semit.* 1 & 3; pag. 288); whilst on one of the Floriana tablets mortar, very like the special mixture largely used in these islands, is distinctly visible. Still, as no strictly conclusive evidence can be adduced on behalf of the latter supposition, I do not classify them for the moment with the Maltese Phœnician Inscriptions.

The Floriana Stelesare votive. They belong to that class called by the Phœnicians *Matsbat*, in Malta *Natsab* (Cf. the Maltese *nasab*, he placed, and *nasba*, a pedestal), a cippus, or pillar consisting in a stone ex-voto ("anathema") offered to the gods in token of their having "heard" the donor's prayer. (1) In this respect they do not differ from the symbolical stones found at Marsascirocco and at Rabat dedicated respectively to Baal Tsor, and to Baal Hammon. (2)

(1) A "*gift.*" See *Cor. Inscr. Semit.* No. 192.

(2) Under the form—not of a candelabrum—but of a cippus or pillar (Herodotus II, 44) was represented the deity. The "statues of Baal" set up by the idolatrous Jews are mentioned in Holy Writ by the name of Matsboth. Cf. II. Kings passim; Mich. V. 12.

POSTSCRIPT

NOTE TO PAGE 17 ON CERTAIN PASSAGES IN THE GREEK VERSION OF HANNO'S PERIPLUS

Kluge in his Notes to Hanno's Periplus (1) gives a different version of the origin of the five cities mentioned in the text.

According to the learned critic Hanno *built* only one town, Thymiaterium, and planted a colony in the isle of Cerne; the Phœnician cities named The Fort of Caricon, Gytta, Acra, Melita, and Arambys were simply *colonised* by the Liby-Phœnicians, having existed long before the great Carthaginian expedition.

It cannot be denied that Kluge's translation of the passage relating to the "foundation" of the five cities on the Atlantic is more accurate and in keeping with the verbal propriety of the Greek version, than the older one; on the other hand, I think, it will be granted, that the meaning of a previous passage in the same Greek version, viz. : "It was decreed that Hanno ... ... should *found* (i. e. build, raise, πόλεις κτίζειν) cities of the Liby-Phœnicians" must be wrestled from its natural sense in order to avoid an opposition between the avowed official object of the expedition, — the "founding" of cities of the Liby-Phœnicians, and its alleged accomplishment, viz.: the planting of a single colony (not a town), and the building of only one city, stocking others already existing with fresh colonists. In other words the Senate would never have meant to raise new cities, but simply to lodge the Liby-Phœnicians in the preexisting Phœnician stations on the Atlantic.

Moreover, another passage in the same text, "We founded the *first* city, Thymiaterium," (2) has for a similar reason to be explained away. For the adjunct "first" in this case appears to be merely an ordinal.

Nevertheless Kluge's version has been readily followed by Movers (*Phœn. II.* 2), C. Müller (*In Geog. Græc. Minor.*, Vol. I, p. 3) and Vivien de St. Martin (*Le Nord de l'Afrique dans l'antiquité grecque et romaine*). From the standpoint of these eminent authorities the explanation given above on the origin of Melita on the Atlantic is untenable. For, if Hanno's settlers found Melita, a city inhabited by their Phœnician kindred, they certainly cannot be said to have named it in honour of the mother-country of Achulla. Moreover, although the patronymic Liby-Phœnicians is strictly applicable to the Achullitans; still, in this case, we would lack a positive reason for asserting that the latter actually took part in Hanno's expedition. Thus, so far, the question of the origin of Melita would remain unsolved.

But, at all events, the case is not hopeless. That the earlier Phœnicians, crossing the Straits of Gibraltar, had established on the western coast of Mauretania cities of their own is admitted by classical and modern geographers. The event is vaguely attributed to the period of Tyre's or, even of Sidon's hegemony. The name of Melita, one of these Phœnician cities on the Atlantic, points out to a national and parental connection with the homonymous "Phœnician Colony" in the Libyan Sea (Malta), the half-way station of the Phœnician vessels bound for "Tharshish and the outer sea". Sidon claimed Malta as her own "daughter", and, later on, Tyre spread equally over her the imperial sway or protection. Consequently the origin of the city, or colony on the Atlantic may for obvious reasons be referred to Malta either thriving under Tyre's protection, or under Sidon's. In the latter case the date of its foundation would be of a very remote antiquity, ranging from the unknown period of the earlier settlements in western Mauretania to about the XI cent. B. C., when Sidon's supremacy was superseded by Tyre.

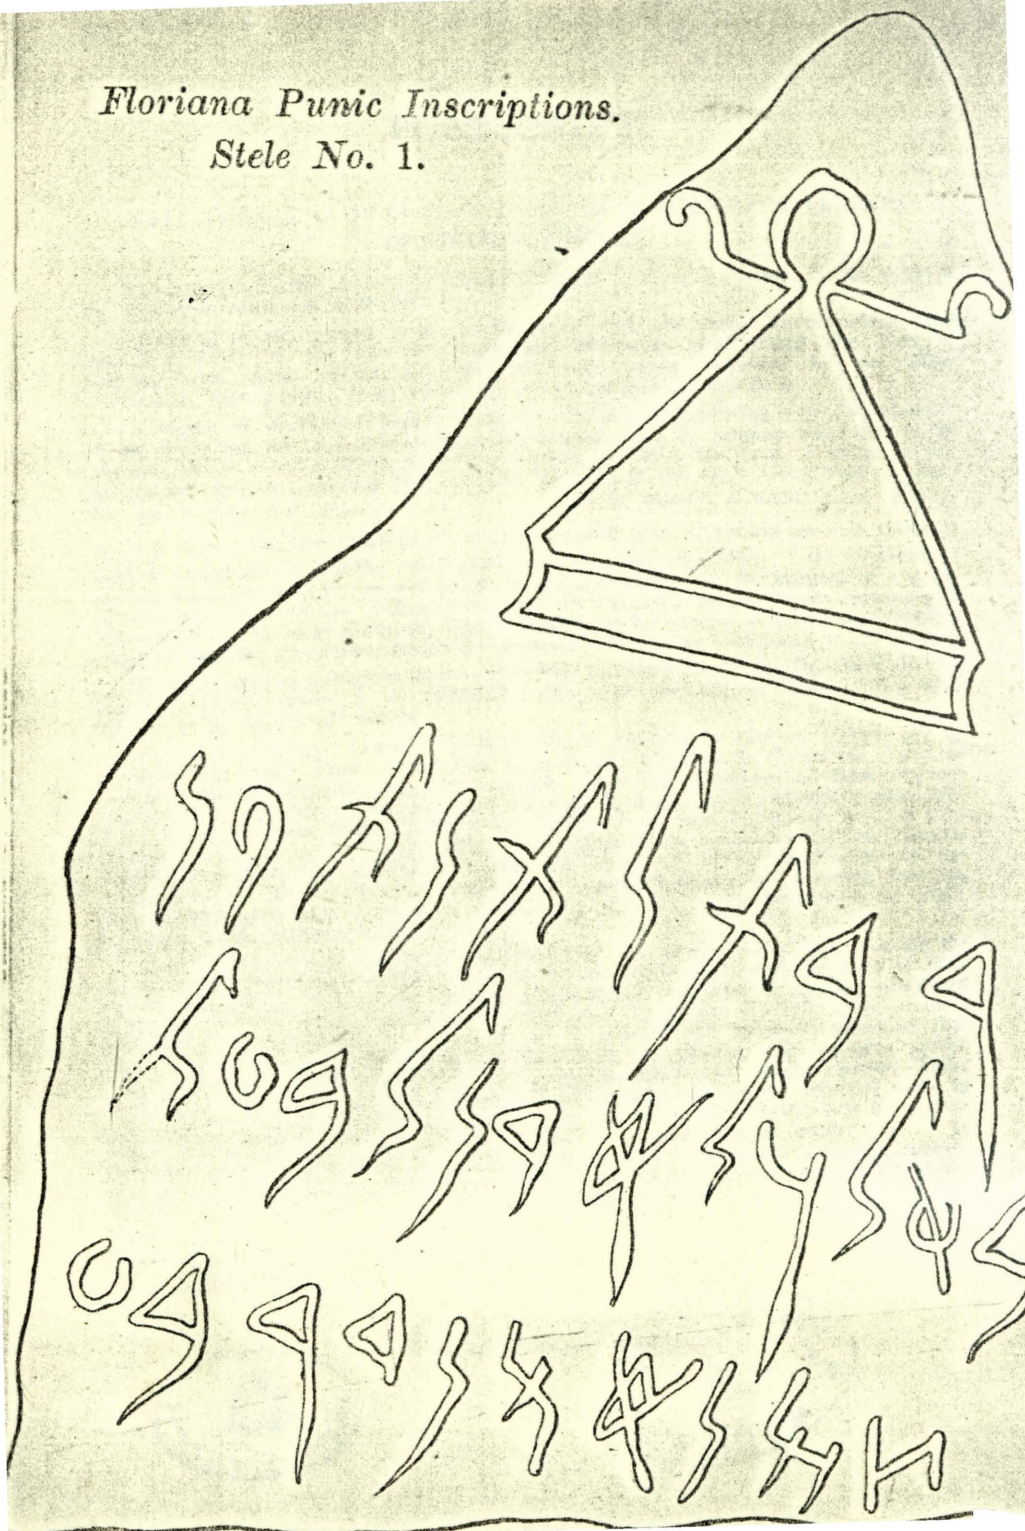
PUBLIC LIBRARY MALTA

Floriana Punic Inscriptions.

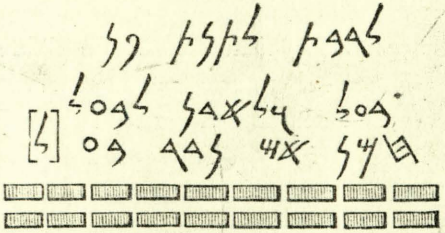
Stele No. 1.



II

Text with Translation and Notes

Stele No. 1 is 8½ in. high and 6⅝ in. at the base, about ¾ in. thick, tapering to a point at the top. But it is only a fragment broken all round, composed of a compact limestone thinly streaked with veins of purple. The front, which bears the inscription, is checkered all over, giving to the surface a wave-like appearance; whilst the sides and the back are simply hammer-dressed. On the upper part is engraved, rather carelessly, the sacred symbol of Baal; under it in three lines are thirtytwo Punic large letters in good style, and neat execution. A flourish is appended to the letter tau (as in the Gozo inscription) and to the lamed. The reading is plain and presents no difficulty. It is here rendered in the Phœnician and Hebrew letters commonly adopted by scholars, and followed by an English translation. The letter within brackets is an obvious restoration.



לרבת לתנת פן
בעל ולאדן לבעל
חמן אש נדר בע[ל]

* * * * * * * * *
* * * * * * * * *
* * * * * * * * *

To the Lady, to Tanit, the countenance of
Baal, and to the Lord, to Baal
Hammon, (the vow) which (1) vowed Baa [l]
* * * * * * *
* * * * * * *

רבת, (Rabbath) corresponds to Lady. Literally it means *great*, an epithet equally bestowed upon mortal women, and upon the goddesses.

תנת, (Tanith, or Tanit) is the Cathaginian deity identified with the "Juno Cœlestis," or "Virgo Cœlestis" of the Latin authors. She differed *only in name* from the female divine principle, which together with Baal her complement, or counterpart constituted the Godhead worshipped by the Phœnicians and other nations of Canaan. Considered in his sideral aspect Baal is the Sun: "Baal Shemesh"; hence his indivisible mate, the Moon, (2) was aptly called his "face" or "countenance".

The Phœnicians gave local geographical names to their common deity. Tanit is believed to be one of them. Still it cannot be said to be exclusively Carthaginian. An inscription raised at Athens over the tomb of a Sidonian, called Abdtanith *(the servant of Tanit)*, shows her worship to have been extended to Phœnicia proper. Ancient authors mention also temples dedicated to her in different places. (3)

The Greeks, who as a general rule, translated into their own language Semitic proper names, in dealing with the different aspects of the Phœnician godhead were obliged to call into contribution their exuberant myths. Hence Astarte, the female divine principle, was by them identified with Hera (Juno), and with the Eastern Artemis (Diana, or Virgo Cœlestis), a virgin goddess armed with the thunderbolt, (4) or with the lance and shield. Latin authors followed the same system. St. Augustin, a native Carthaginian, distinctly says: "Juno without any doubt is called Astarte by the Carthaginians". (5) The same identifies her with the Roman Ceres, Vesta and Venus. (6)

(1) Or what vowed ("quod vovit").

(4) See coin of Carthage struck under Septim. Severus.
(5) *Quæst. XVI in Jud.*
(6) *De Civit. Dei*, IV., 10.

Lastly on an inscription found by Sainte-Marie at Carthage, (1) she is styled "Mother," a title most fitting to Astarte, the nature-goddess, the "queen of increase and fecundity."

Juno's, i. e. Astarte's temple in Malta enjoyed a world-wide renown. A cursory glance at the autonomous coins of these islands will convince any one that the sympathies of the inhabitants lay with the "Queen of heaven" (Jer. VII. 18). Her image, either crowned and veiled, or represented as Isis, (2) bearing on her head the sacred Uraei, and the royal feathers, (3) recurs on nearly all the Maltese types, irrespective of the language of the corresponding legend; whilst Gozo delighted in representing her armed with the helmet, shield and lance, (4) and associated with her distinctive symbols, the crescent and the star.

Tanit's name in ancient monuments occurs on votive steles, and on the famous inscription from the Necropolis near St Monica's, close to Borj Djedid in Carthage. Nevertheless it has been often remarked, that allusion to her is made in the fragments of Phœnician theogony by Philo Byblius, or of Gebal, preserved by Eusebius in his *Præparatio Evangelica*. According to Philo the *Titanides (Tanitides?)* were daughters of *El* and his sister *Astarte*. Philo, a Phœnician of the I cent. of our era, wrote in Greek, presumably only translating from his native language a very ancient work by Sanchuniathon, said to have flourished long before the fall of Troy. It is however obvious that Philo treats his subject according to the later Greek Euhemeristic theory (5) on the origin of the gods. Hence the Godhead and His different names, or attributes which in the course of time came to be recognised as distinct deities, are by Philo represented as men and women, who lived in Phœnicia. *El*, one of the names of God common to all the Semites, sank, by the introduction of Polytheism, into an inferior rank. This system could not consistently conceive him without a wife. Accordingly "*Ashtaroth*" was admitted into the Phœnician

---

(1) *Corpus. Inscrip. Semit.* No. 195.
(2) One of the myths of Isis is connected with Phœnicia. See coins of Byblus.
(3) See also coins of Cossura (Pantelleria).
(4) Dr. Mayr (*Die Antiken Münzen der Inseln Malta, Gozo und Pantelleria*, Munchen, 1895) is of opinion that the figure on the reverse of the Gezo coins is a male divinity.
(5) Euhemerus flourished in the IV cent. B.C.

Pantheon as his consort, whether she be an import from Babylon, (1) or an exponent of the Canaanite idiosyncrasy of the time. (2).

Philo, as has been observed, relates that Astarte bore to El the Titanides (Tanitides ?); at the same time we find the latter (though in the singular) identified, with a slight variation in orthography, with their own mother, among the Persians, Armenians, and other nations in the East. Pausanias speaks of *Artemis Anaïtis* (3) worshipped by the Lydians. Zela was one of the chief seats of Anaïtis. Her temple is represented on an imperial coin of Septimius Severus, a Carthaginian native of Leptis Magna well known for his enthusiastic admiration for whatever is connected with Phœnicia. Clement of Alexandria (4) on the authority of Berosus relates that Artaxerses II introduced into his states the veneration of images instead of fire-worship; setting up the idol of "*Aphrodite Tanaïs* at Babylon, and other cities, and causing her to be adored by the Persians, Bactrians, and the people of Damascus and Sardes.

From Strabo may be gathered (5) how extensively the worship of the goddess had prevailed in the East.

Sallust, (6) on the authority of a Carthaginian work by king Hiempsal, relates that the Phœnicians were preceded on the continent of Libya by Medes, Persians and Armenians, who eventually settled in the country. "They mingled with the Gætulians by means of marriages, and called themselves Numidians" (7). If this account is reliable, (8) the Phœnicians found the worship of Tanaïs already established in the land close to their future metropolis. (9)

Indeed Tunis in Punic is written in the same manner as Tanaïs (תנת, Tnth), the final th being pronounced, as is often the case, as an s.

---

(1) Ishtar.

(2) The Jews call this goddess Ashtoreth, and her statues Ashtaroth; the latter word however is also used as a common noun. See in the *text* of Deut. VII, 13; XXVIII, 4, 18, 51 the equivalents of the words translated by "the flocks of thy sheep."

(3) Bk. VII. c. VI, 4.

(4) Protrep. V.

(5) XVI, 1, 4.

(6) Bell. *Jugurth.*, § 18. (7) Loc. cit.

(8) Movers rejects it altogether.

(9) "The Numo-Numidæ.... possessed that region, which being close to Carthage is called Numidia". Sallust. *ibid.*

No considerable trimming was required on their part to honour in the Lydian, or Median deity their own Ashtaroth. In fact the chief characteristics are common to both deities, Tanaïs being identified with Aphrodite and Artemis, as has been remarked before. Thus the Phœnician Baal gave up none of his rights: he remained supreme. His feminine aspect was unchanged, whether it was styled Tanith, or Ashtaroth. In both cases, it was merely his "countenance," or his "name." (1) Thus also, strictly speaking, his two aspects, the masculine and the feminine, cannot be said to have been split up into two distinct deities. And this is what puzzled foreigners, and gave rise to the formula handed down by Macrobius: "If it be a god, or if it be a goddess, under whose protectorship is the people and the city of Carthage." (2)

Astarte and Tanit have been generally taken as one and the same till the finding in 1898 of the dedicatory inscription recorded in pag. 7. From its heading, "To the goddess Ashtaroth and to the [goddess] Tanit of Lebanon, two new sanctuaries," it would appear that they were considered as two distinct deities. Hence it is that M. Philippe Berger is of opinion that they correspond respectively to Demeter and Persephone, and M. Clermont-Ganneau before him, identified two deities mentioned on a Carthaginian ex-voto with the two Greek goddesses to whom the Carthaginians raised sanctuaries in their capital in B. C. 396.

But enough has been said to enable us to come to the conclusion that this distinction is nominal. Tanit is "the face of Baal Hammon," or of the National godhead in his solar aspect. Her characteristic attributes are those of Baal's companion. The philosophical conception of Baal was too deeply rooted in the Phœnician mind to be easely affected by Hellenism. In fact the Phœnicians pretended to be superior to the Greeks "in all divine things" Poets and popular usage might indulge in local, or apparently personal distinctions, in different titles, or

(1) "Ashtaroth shem Baal." Eshmunazar's Inscription.
(2) *Saturnal*, III. 9.

PUBLIC LIBRARY MALTA

adaptations to foreign conceptions, and even in different shrines within, or round the same temple; (1) but that the Carthaginians should in latter times have given up the notion which underlies the National religious system by splitting up in two the "Great Queen of heaven," or by substituting the daughter for her mother (see pag. 7) is hard to conceive, or reconcile with the authorities quoted above.

No doubt polytheism is inconsistent; still when allied with pantheism and symbolism, it can weave anything out of the same substance, or explain away its productions, (2) as the case may be, without affecting the nature, or singleness of the same. (3)

פן בעל, *face of the Lord.* פנה, *Phaneh* is the outward appearance of things, also self, and the human face. In the first sense, "Baal's face," or "countenance" may be rendered: his external manifestation, and in the sideral meaning, his reflection. Thus Apulejus of Madaura, an African philosopher (4) cited above, addresses Tanit: "Prima Cœlitum, deorum, dearumque *facies* uniformis....cujus numen unicum, multiformi specie..... nomine multijugo totus veneratur orbis." (5)

In the third sense is used in Holy Writ in composition with El as a local name in Palestine: "And Jacob called the name of the place Phanuel, (6) saying: I have seen God face to face" (7). Two men called Phanuel are also mentioned in I. Chron.

בעל, *Baal* means lord, owner and husband. But preeminently "The Lord" is the god of Phœnicia. His name in full seems to have been: "Melkarth, Baal Tsor," that is: the King of the earth, lord of Tyre. (8)

---

(1) "Apud Africam Carthagini *Cœlestis* inesse ferebant templum nimis amplum, *omnium deorum suorum aedibus vallatum.*" St. Prosper Aquitan., Op. III. This temple was completely destroyed in A. D. 421.

(2) A man from Sidon told Pausanias (Bk. VII. 24) that according to the Phœnician belief Asclepius is the *Air*... "Apollinem igitur *qui sol ipse sit* jure patrem Asclepii perhiberi, quod accommodatum anni temporibus cursum peragens *aeris salubritatem* (Hygeia) impertiat." *Ibid.* loc. cit. Didot's Edition.

(3) Thus Apulejus (*Metamorph. XI*, loc. cit.) addresses the national deity: "Rerum natura parens, elementorum omnium domina, sæculorum progenies initialis, *summa numinum*, regina manium."

(4) "Nobilis philosophus." St. Augustin, *De Civit. Dei.*

(5) Loc. cit.

(6) *Phnuel*, God's face.

(7) Gen. XXII, 30.

(8) Malta Inscriptions, I. (Nos. 122, 122 bis, *Corp. Inscr. Sem.*)

אדן, *Adon* is lord, master.

בעל המן, *Baal Hammon* is Baal in his solar aspect (1) to whom according to *Sanchuniathon:* "When great drought came, they stretched forth their hands to heaven, towards the sun; for him they thought the only god and lord of heaven, calling him Beelsamon, (2) which in Phœnician is lord of heaven, and in Greek Zeus." (3).

Under the title of Hammon he was especially honoured in North Africa and in the Western Colonies. Two stelae dedicated to him have been found in Malta.

איש, *Ish* is a pronoun.

נדר, *Noder* is vowed. The Phœnician crew in Jonah's ship, besides sacrificing victims, *made vows* to the Lord in gratitude of having been saved from shipwreck. (4)

"Baal" is the donor's name, or most likely only a prefix to it; for the inscription ends here. Its incompleteness is greatly to be regretted as it precludes the possibility of knowing those particulars which are generally expressed on votive stelae, viz; the donor's pedigree and social position, and at times, even the motives of his oblation. A deprecatory formula generally expressed by such words: as—

כשמע קלא
תברכא
כשמע קלא

"Ubi audiverit ejus vocem, ei benedicat," (5); or "Lors qu' il a entendu leurs voix, il les a benis;" or simply, "Ubi audiverit vocem ejus," (6) is always appended to these inscriptions.

This inscription was engraved before the fall of Carthage. Its epigraphy bears unmistakable evidence of the halcyon days of Punic calligraphy: prolonged legs elegantly curved, the flourish on the lamed and tau, bold and neat execution. The extreme limits of the use of the latter Phœnician alphabet, properly so called, are from 350

(1) Hammah, poetically is the sun. See Job XXX, 28; Cant. VI, 10.
(2) Baal Shamin.

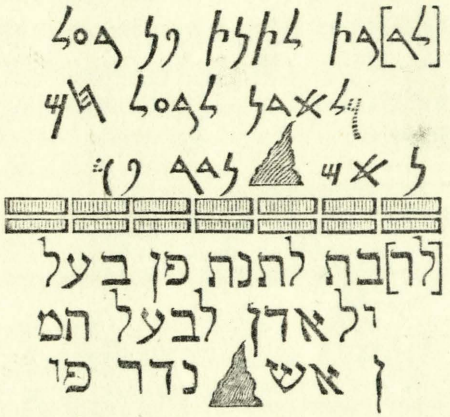
(6) M. de Saulcy on the twin Maltese cippi.

ROYAL MALTA LIBRARY

to 150, or 100 B.C. It is not easy to determine how much longer it lingered in the colonies.

Stele No. 2 is also a fragment of the same checkered material as the preceding, measuring $6\frac{5}{8}$ in. by nearly 5 in. at the base, and $3\frac{3}{8}$ in. in thickness. The letters are smaller, neatly engraved, and disposed in three lines. Its contents are:



* * * * * *
* * * * * *
* * * * * *

Which may be rendered in English :

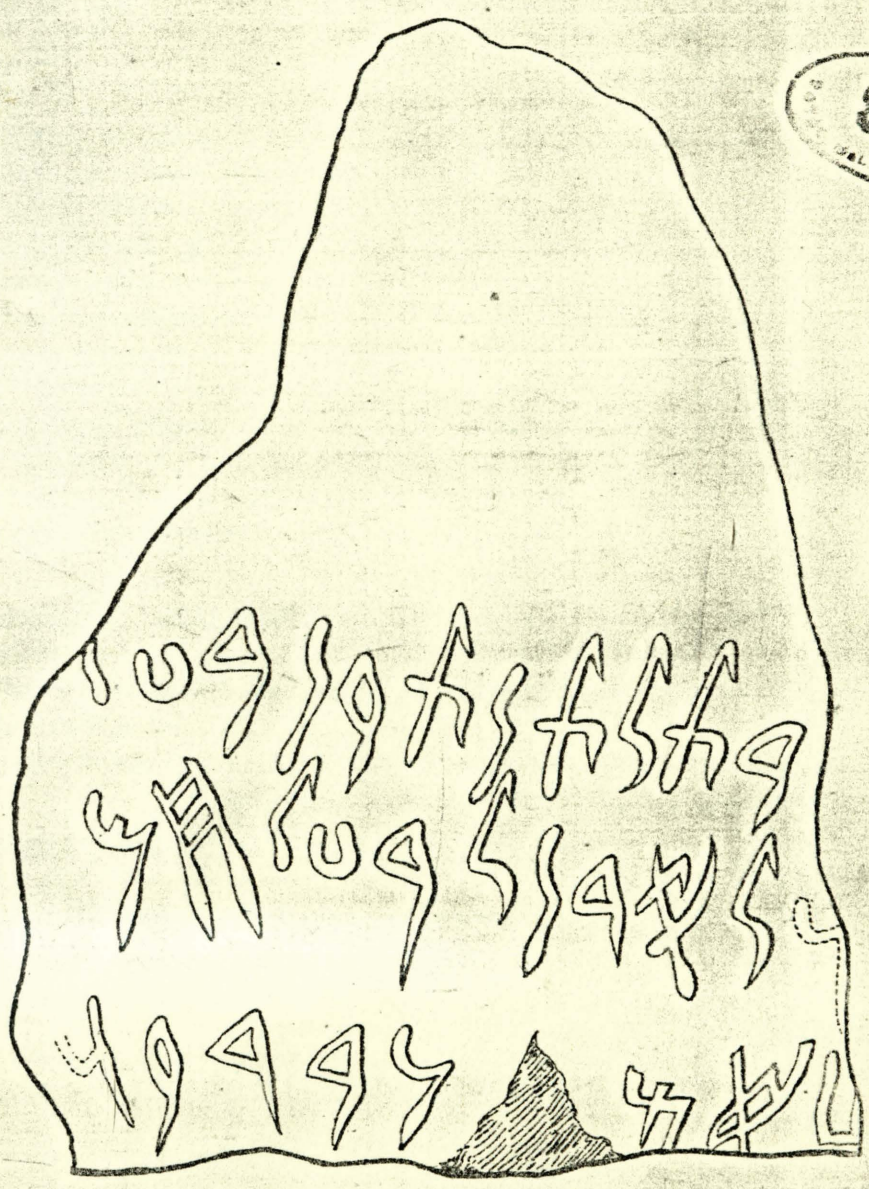
[To the La]dy, to Tanit, the countenance of Baal,
And to the Lord, to Baal Hamm—
on ? (the vow) which vowed Py...

* * * * * *
* * * * * *
* * * * * *

At the end of the second line the letters heth and mem are certain; they should be followed by a nun to complete the word Hamon (Hammon). It is practically certain that the nun was engraved at the beginning of the next line, although what appears on the stone is only a faint representation of the upper portion of an almost straight letter bent at its centre towards the right. According to general usage the latter would correspond to a lamed, and not to a nun. This objection may be heightened by the consideration that the engraver distinguishes with the utmost care his nuns from the lameds, and gives to all his

Floriana Punic Inscriptions.

Stele No. 2.



MALTA

Lit P. Bonavia - Malta -

letters a slanting position. If then the letter in question is a lamed, the reading should be altered thus :—

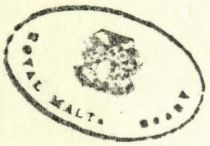
. . . . . to Baal Hamm [on]

To Esh (?) (1).....vowed Py.....

* * * * * *

* * * * * *

* * * * * *



Nevertheless a) the upper portion of a nun is sometimes unduly prolonged, and what is still visible on the stone running to the right may be an arc (2) of the curve required to complete the middle portion of a nun; b) the space between the word אש (which) and נדר (vowed) obviously has been left void by reason of a depression on the stone ; the more so that there is not the slightest trace of engraving to the right of the depression, what would almost be an impossibility in the contrary supposition, as on the space covered by the depression the two letters aleph and shin ("which"), absolutely required by the context, could not have been engraved, at least to a size in keeping with the rest. Consequently the former reading, in conformity with the stereotyped formula of the Tanit inscriptions, ought to be retained.

The donor's name is expressed only by two letters. The rest is wanting. The former letter is a pe; of the latter only a long stroke is clearly discernible: the remainder looks like the complement of a vau. Consequently we have: Py.... It may be restored, and derived with Gesenius from Phomat, rendered in Greek: Pymatos. A man of Citium, a Phœnician settlement in Cyprus, bore that name.

This tablet is only the upper portion of a Stele broken on all sides. As this kind of steles is at the utmost about 20 in. high, the missing portion possibly measured 13 in. in length. (3) Their upper part either terminates in an acute angle, or in an pedimental form with elevations at the corners ("Acroteria").

---

(1) Fire, brightness of fire; (whole-burnt sacrifice). See Numidian Inscriptions, Gesen. VI & VII.

(2) Or a straight line. The middle portion of a nun is often a straight line.

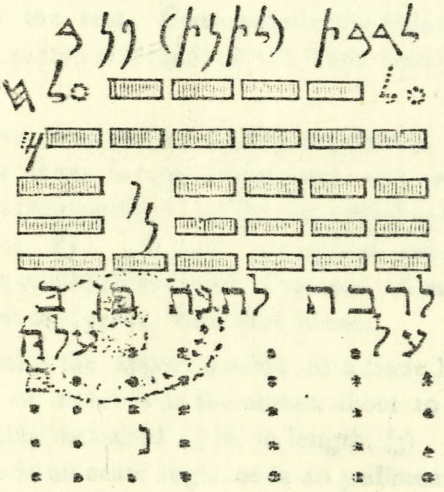
(3) Other steles vary in size generally from 5 to 12½ in. in height; from 4 to 7 in. in width, and from 1½ to 4 in. in thickness.

The remarks made on the age of the previous inscription apply with greater reason to the present.

Stele No. 3 consists of a fine limestone 12 in. high (at the back $14\frac{1}{8}$ in.) by 5 in. at the base, varying in thickness from $3\frac{1}{2}$ to 4 in. The top of the upper part which terminated in a pedimental form with acroteria at the corners is mutilated, and the remaining surface has partially peeled off, leaving however in a state of almost perfect preservation a winged globe flanked by two uræi, the Phœnician sacred symbol of the divinity. Under it within a panel, was engraved with the utmost neatness and precision the inscription. But the stone within the panel has also peeled off, with the exception of the upper portion of the first line, and of a few odd letters. The remainder of the tablet is ornamented with heart mouldings. The base is also mutilated.

The remaining contents of the inscription may be restored, the letters within bracktes being visible on the stone only in part.

Read accordingly :



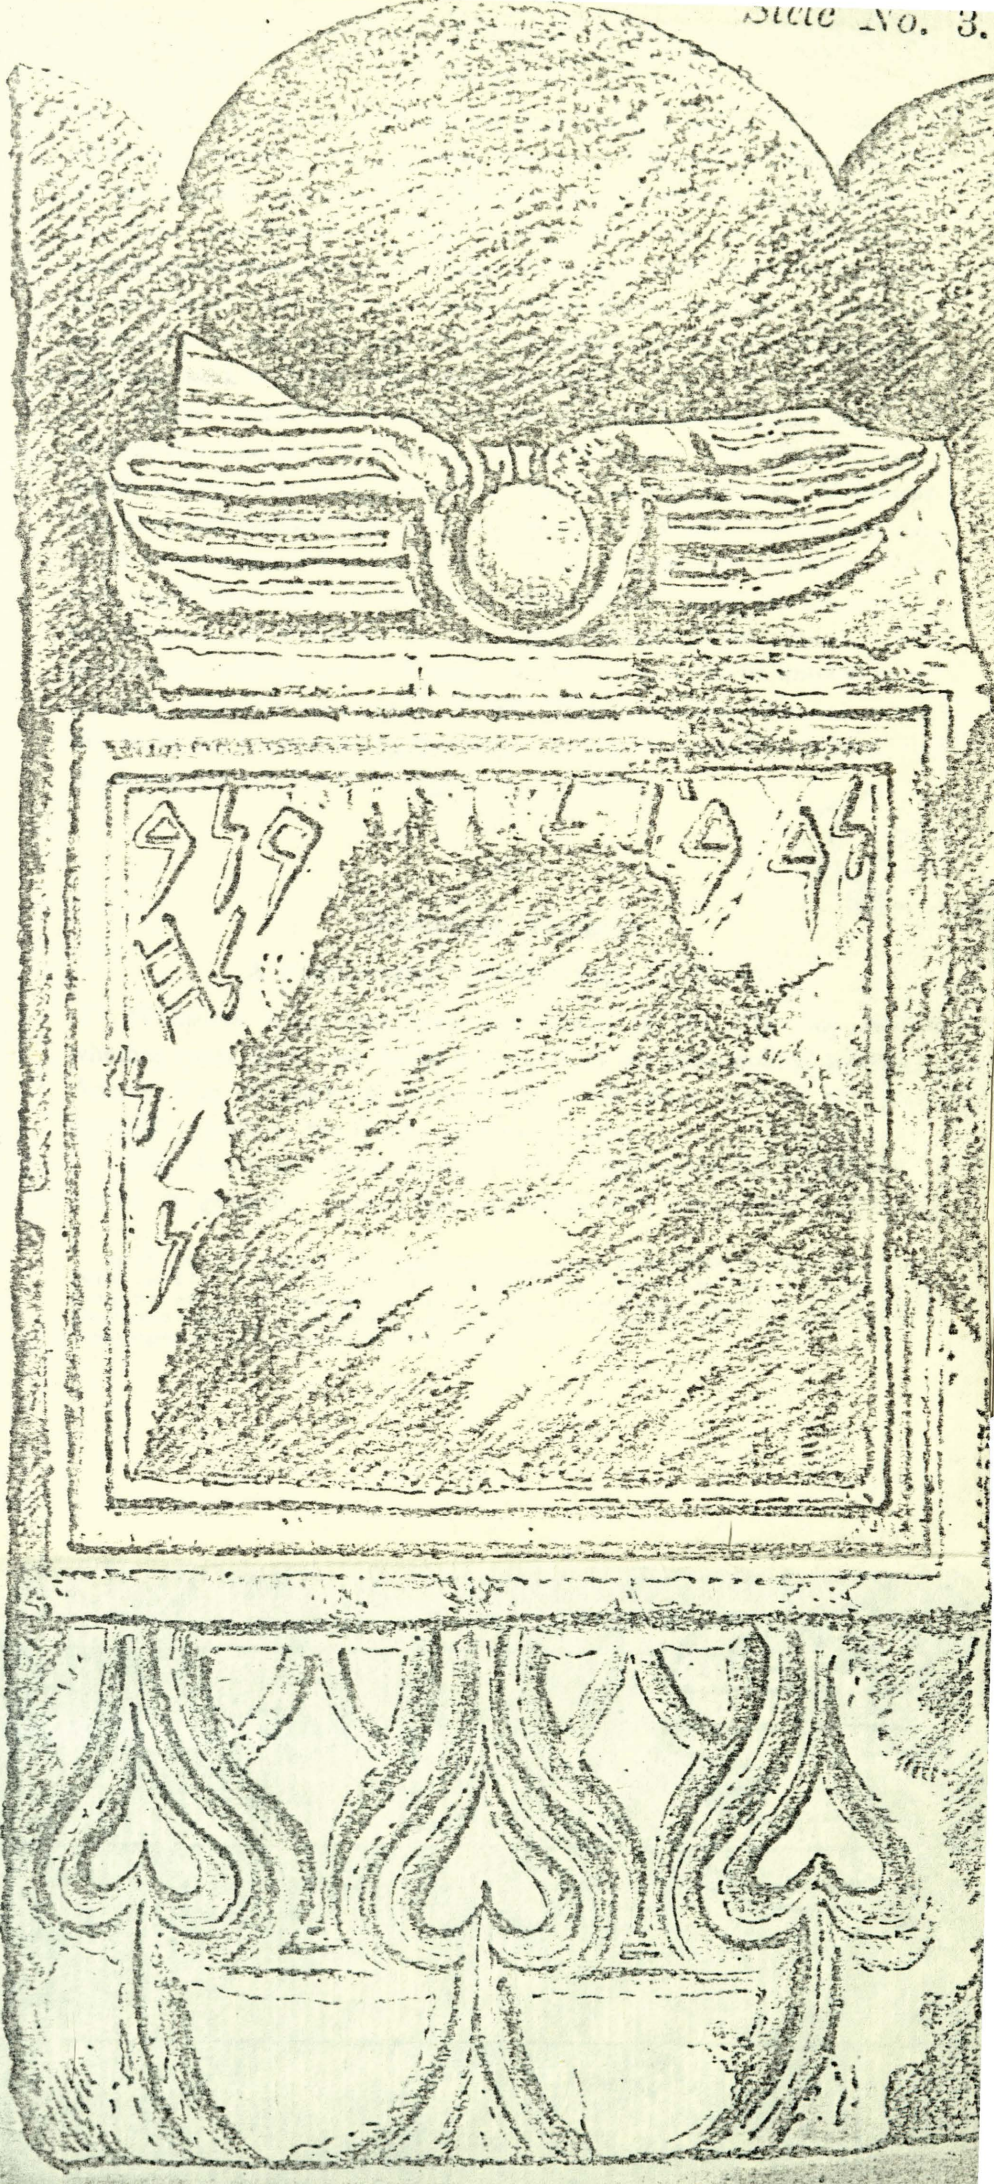
Which may be translated :—

To the Lady, to Tanit the countenance of Ba-

[al] * * * * [Baa] l Ha-

[mon ?] * * * * * * m

* * * * * * *



There can be no doubt on the nature of this tablet. The heading of the inscription is identical with the preceeding two; but the total loss of the sequel is greatly to be regretted, as this stele is not only one of the best specimens of Punic paleography, but in its ornamental mouldings bears evidence of a taste very rarely to be met with in works of this kind. Art in votive Carthaginian steles remained uncouth and stationary to the very last; whilst epigraphy and its neat workmanship rose and sank with the fortunes of the nation.

Votive sacred art therefore is not a test of Carthaginian skill. In civil art the daughter of Tyre was second to none. Her glorious relics, which escaped the savage rivalry of Rome, now grace many Museums. We have suffered, and still suffer our share—and it was a prominent one —(1) to be scattered to the winds. Only to quote one example, about four years ago a lady hailing from Malta called upon the manager of the Museum of Palermo to show him a Phœnician Inscription. The gentleman was absent. As soon as the fact came to be known, every possible research was made by the Directors of the Museum to find the lady; but it proved unsuccessful. It may be taken for granted that the stone has not found its way back to Malta.

III

Historical Remarks

A Continental Dependency of Malta

Whatever may have been the origin of the Floriana Steles, whether they were set up in a local, or in the metropolitan temple of Astarte, they belong to the time of the Punic wars, one of the most eventful periods in the history of these islands.

Our historians have touched very lightly upon the Carthaginian period in general. In fact they appear to have completely overlooked

(1) Cf. *Descriptio Melitæ* by Br. Quintin, Secretary to Grand Master Villiers de l' Isle-Adam. *Manos. Inediti No. XVII*, at the P. Lib., Valletta.—The image of Juno (Astarte) in solid gold, weighing over 200 French lbs., and the two crystal sphinxes resting on balls of polished jasper, placed at the sides of it in the great temple of Malta, were carried away with the treasure of the temple by Gader, a pirate. Cf. A. Thevet, *Cosmographie Univ.*, C. XII, pag. 25, Paris 1575.

two leading events illustrative not only of the political, but also of the religious and national relations of Malta with the Liby-Phœnician continent and the State of Carthage.

As they both bear upon the subject of this paper, I will detail them as briefly, as possible.

The first is the planting of a Maltese colony and state on the shore of the Byzacene province of Africa in "Syrtica" "between Thapsus (1) and Ruspæ (2)" (Ptolomy), or "not far from the Syrtis, 120 stadia (15 miles) from Salipota" (3), corresponding to 35° 6′ or 8′ N. lat. (circ.)

The Greek and Latin classics called it Acholla, or Acola, or Cholla, or Achilla, or Acilla, and even Aquila; but on coins is undoubtedly Achulla. Scholars do not agree as to its real Phœnician name, whether it be *Kir* (a city, a fortified place), or *Aclah* (provisions, such as wheat), or *Agulla* (round); whilst the appellation of *El 'Aliah* (4) (high), by which its extensive ruins are at present styled, although very likely preexisting to the Arab invasion, still is far from being a clue for settling the question.

It is Stephen of Byzantium who handed down that "Acholla is a colony of the Maltese." (5) Although Stephen wrote his *Ethnica* and *Dictionary of Geography and History* as late as the end of the fifth cent. A.C.; still he is justly held to be the faithful exponent of the geographical and historical lore of the ancients. Müller, treating on the coins of Achulla, (6) endorses his authority; and Mr. Barclay-Head in his standard work on Greek Numismatics, wrote: "Achulla, a colony from the island of Melite." (7) The same countermark on the coins of Achulla and Hadrumetum, (8) both struck during the Roman dominion, show that our colony had a special and political connection

(8) The capital of Byzacene, situated about 82 miles from Carthage.

with the chief city in the province of Byzacium. Thus Malta, owing especially to a custom strictly adhered to by the Phœnicians, was placed, even under the Romans, in close touch with the land where Tanit was honoured. For the colonies ever kept a dutiful, religious and permanent communication with the parent state. In our case vicinity and a brisk trade contributed to tighten such mutual relations.

What is known of the history and ruins of the city and state of *Achulla* will be related in another paper.

The second historical fact mentioned above is recorded in *"Hanno's Periplus."* "Hanno, commander of the Carthaginians", thus he writes in his "Voyage round parts of Libya beyond the pillars of Hercules":— "It was decreed by the Carthaginians that Hanno should sail beyond the Pillars of Hercules (the Straits of Gibraltar), and found cities of the Liby-Phœnicians. Accordingly he sailed..... and a multitude of men and women to the number of 30,000, and provisions and other equipment".

.....

"After we had gone..... beyond the lakes (north of Wady Draa in Mauretania), we founded cities near the sea, of which the names were The Fort of Caricon, Gytta, Acra, Melita, and Arambys."

Hanno's Periplus exists only in a Greek MS. in the Library of Heidelberg, and it was first published in 1533.

Bochart was of opinion that the names of the cities mentioned in the MS. are Phœnician "parce detorta"; but it is generally held that they are Greek translations, (1) or in some cases adaptations, that of Melita, with which the Greeks at the time of the event were already familiar, and perhaps of Gytta, being excepted. (2)

Although the Greek text has Melitta (3) and Hecatæus wrote

(1) *Geographi Graeci Min.*—*Not. in Hannonem*, Edit. Oxon.
(2) Gesenius, *Monum. Phœnic*, sub v. Gytte.
(3) This form renders better the Semitic מלטה, Malitah; the letter teth being equivalent to an emphatic t (Gesen. *Lex. Man. Heb.* s.v.), is conveniently expressed in Greek by a double t. The Greeks however disregarded such an accuracy: thus the authors of the Septuagint in dealing with the same letter teth, are satisfied with a single t.

Melissa; still scholars suggest Melite, or Melita as the most likely reading. (1)

The position of Melita has not been determined with certainty. Starting from Solœis (Cape Cantin), Hanno proceeded half-a-day's journey till he reached a lake lying not far from the sea. After he had gone a day's sail beyond the lakes, he founded the five cities already mentioned. Sailing from the last one he came to the Lixus, the modern Wady Draa. (2) As Acra stood on the river Subus at Lat. N. 30°, 29'., (3) the next city, Melita, was consequently further south, somewhere at the foot of mount Dyrim, known by the Greeks as Atlas Megas or the Great Atlas, on the western coast of the Atlantic.

A new city called Melita, or Melite founded by Phœnician settlers, can only refer to Malta and its inhabitants, as the founders had no national connection with the other Melitæ mentioned by Greek authors. A different explanation drawn from Phœnician etymology, (4) and based upon a possible similarity in the aspect of the place and of old Melita, is unwarranted and too far fetched.

Moreover the consideration of the ethnic origin of the majority of the colonists will lead almost to the same conclusion.

The Phœnicians settled on the shores of the second and third basin of the Mediterranean were called Liby-Phœnicians in contradistinction to the Syro-Phœnicians, (5) who lived in Phœnicia proper. However, in the present case, there was no reason why the Senate of Carthage should make use of such a distinction. Consequently the determination related in Hanno's Periplus had reference to a peculiar class of subjects who were called Liby-Phœnicians in a still stricter sense, being the offspring of Phœnicians married with Libyans. (6) The chief seat of the latter was round lake Triton in the Lesser

PUBLIC LIBRARY MALTA

Syrtis. (1) The petty Phœnician states on the S.W. coast were conterminous with the Libyan territory properly so called. Hen the course of time the inhabitants of Byzacene were by reaso intermarriage called Liby-Phœnicians. (2) A portion, at least, o Maltese colonists of Achulla in southern Byzacene, was conseque strictly included under the same denomination of Liby-Phœnicians.

It remains to be ascertained whether Melita on the Atlantic its name directly to Achulla, or, in some way or other, to an influe section of emigrants of pure Maltese origin, who as Western Phœni from an important and sea-fearing senior state in alliance Carthage, (3) would find special favour and official protection i new settlement, since the Metropolis is known to have regarde Liby-Phœnicians by birth with extreme jealousy and distrust. (4)

Achulla is believed to have been founded at a remote antic long before its mother-country became a dependency of Carthage and Hanno's expedition, as the following considerations will show, place early in the VI cent. B. C. As colonists give names to their settlements after those of their old homes; it is hard to infer that Achullitans (unless perchance they continued to call themselves Malt after the lapse of long centuries, would, of their own accord, p the old mother-country to their own in giving the name to the settlement. (6)

This is all that can be said without entering into the doma conjectures. We lack positive data. The only known, but very re link at our disposal, is an inscription preserved in the Museum, o

(1) Pseudo-Scylax in *Periplo*, cap. *Lotophagi*.

(2) Plin. v, 4; Justin. *Cod.* I. 27. 2. See also Strabo.

(3) After the decline of Tyre, Carthage in the VI cent. B.C. rallied together with complete the Western Phœnicians against the encroachments of the Hellenes, the common national foes a competitors in commerce. Their mutual political ties were at first federal; but at the hands of the republic, alliance became protection, which eventually drifted into dominion.

(4) In sending out Libyan, or Liby-Phœnician colonies, the State took care that a number of *Ph* citizens should permanently join the expedition. Diod. XIII, 79.

(5) Movers, Phœn., II, 2; Müller, Op. cit., II, pag. 43.

(6) One of the Kerkenna Islands to the S. of Kapoudia is *Melita* (al. Mellita), the Cerc Strabo and Pliny. It appears that no ancient author Greek, or Latin ever designated it by such Sir Grenville Temple called it *Gherba*; but the latest charts, drawn according to information French Government have Melita. Lindberg is of opinion that the countermark *Kir* on the coins of belongs to Cercina Island, the largest of the group. But in any case, a political connection of the Roman period, could hardly be stretched to the VI century B. C.

Valletta Public Library, containing the words ΑΘΛΑΣ (sic) ΜΕΓΑΣ in archaic, or rather in pseudo-archaic letters written from right to left *(retrograde)* between a star and a trident. The star is a well recognized distinctive characteristic of Phœnician monuments; whilst the trident points to a sea-town, or what practically comes to the same thing, is a symbol of a marine deity. If really the inscription be genuine and can be referred to a remote antiquity, we would have a feeble, but plausible local allusion to Melita, a sea-town on the Atlantic ocean, and on the *Atlas Megas*, i. e. the Greater Atlas range.

At all events in the almost complete lack of details in our ancient history, Hanno's narrative is a flood of light. Hanno is supposed to have been either the father, or the son of Hamilcar who lost the battle of Himera in B. C. 480. It is not at all likely that Carthage after a threefold reverse by which she lost her cavalry and chariots, 300,000 troops, (1) and 3,000 vessels of war and commerce, would undertake such a wholesale expedition, as is described by Hanno. The latter therefore must have been Hamilcar's father. In this case the date of the founding of Melita on the Atlantic would be about B. C. 520.

It thus follows that the destinies of the Maltese colonists were linked with those of Carthage at that early date; that Achulla had at the time a surplus population; and lastly, that the city or island of Malta was held in such high consideration that of the six new cities, (2) one was called after her name.

It follows likewise, that the landmarks of the history of Malta can no longer be confined within the boundaries of these shores. They may still be widened by further research, leading to discoveries that might bridge over some of the many chasms in our ancient history. The ruins of Achulla are to this day a virgin soil, and many existing antiquities in Malta are either practically unknown, or buried in the ground. It is, therefore, only reasonable—at least—strongly to impress the advisability of protecting those public and private monuments in these

---

(1) Federal and Auxiliary Forces.
(2) Thymiaterium, is another city founded by Hanno, not mentioned in my quotation from his Periplus.

islands which are fast disappearing by the hands of unprincipled tomb breakers, and treasure seekers.

Lastly, let us trust that the Floriana Steles may ever remain as well preserved, as they are at present, either by intelligent collectors of antiquities, or better still, in a local Museum.

The Right Rev. Mgrs. Canons Falzon, and Caruana Dingli have kindly consented to allow me to take a gypsum ectype of their Punic Inscriptions, which I shall forward to the Museum of the Public Library.

Trade or diplomacy? Assyria and Dilmun in the eighteenth century BC

Jesper Eidem and Flemming Højlund

Introduction

A special characteristic of Mesopotamian archaeology is the potentially high degree of convergence between documentary and other evidence. Excavations of sites and levels post-dating c. 3000 BC often produce cuneiform inscriptions *in situ*, prominently on clay tablets and occasionally in great numbers in the shape of archives or libraries. It has long been recognized that this feature is of great value for comprehensive analysis of specific data sets, but recent studies also suggest that Mesopotamian examples could be used to test some historical assumptions made for other regions where no comparable documentary evidence is available (Kramer 1977). Obviously this situation calls for complementary expertise, individual or collective, and such is increasingly being applied in research on ancient Mesopotamia (cf. Postgate 1990).

Moving outside Mesopotamia proper, however, especially to the east and south, the degree of convergence between documentary and other data generally decreases and takes on a different character. In Iran and in eastern Arabia epigraphic finds remain rare until the late first millennium BC; on the other hand these regions to some extent are documented in Mesopotamian sources. As a consequence the expertise needed to deal with the convergence is harder to muster, and some confusion may result. In this short paper we shall examine one possible case of such confusion and suggest how to resolve it by a complementary approach.

Our example concerns relations between Mesopotamia and areas of eastern Arabia, i.e. Kuwait, north-eastern Saudi Arabia and Bahrain, which in cuneiform sources were referred to as Dilmun, although the exact extent of the area thus named clearly varied through time. Dilmun appears in Mesopotamian sources virtually from the very beginning of writing in the late fourth millennium BC and continues to figure as a place from which important trade goods arrived in Mesopotamia, either goods coming from the Arabian peninsular or in transit from regions further away like the Indus Valley (Heimpel 1987). The mechanics of these trade relations are variously, but generally, poorly documented. The best evidence stems from the early second millennium BC, when cuneiform records found in city-states of lower Mesopotamia record how traders went to Dilmun and brought back products like copper, carnelian and ivory ultimately deriving from Oman and India.

World Archaeology *Volume 24 No. 3* *Ancient Trade: New Perspectives*
© Routledge 1993 0043–8243/93/2403/441 $3.00/1

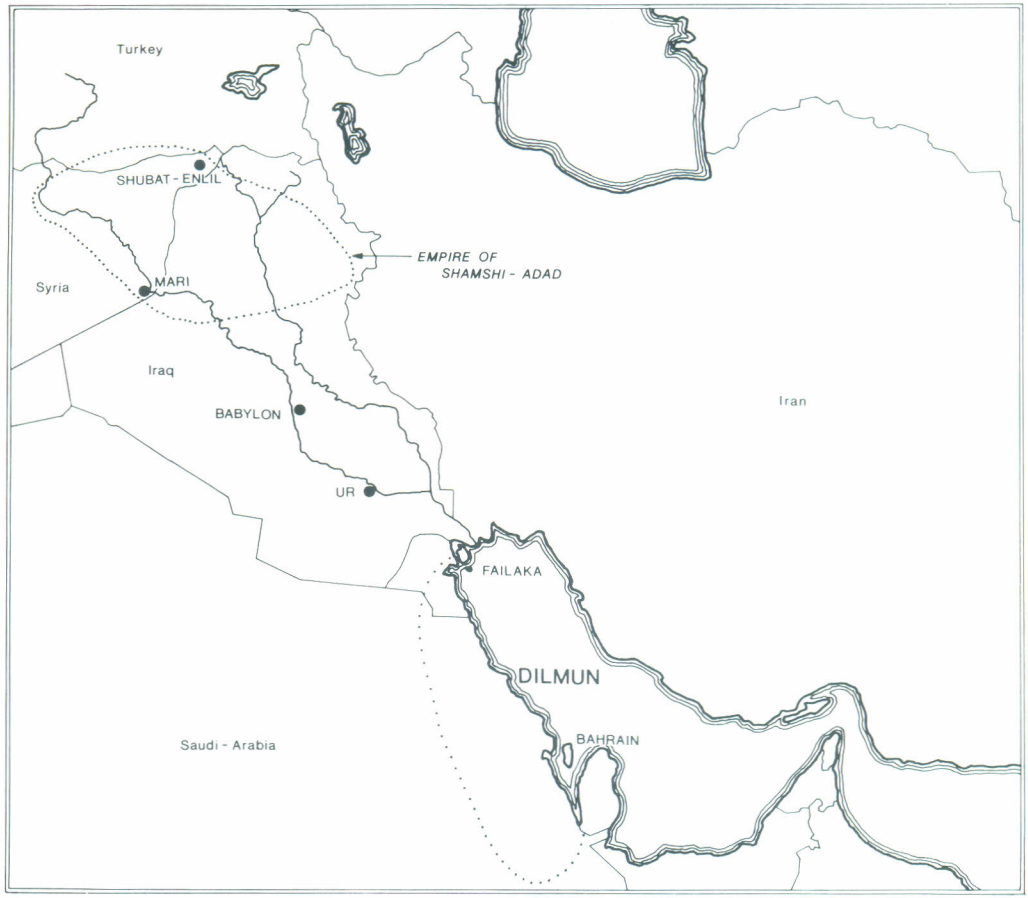

Figure 1 Map showing location of sites and areas discussed in text. The extent of the empire of Shamshi-Adad can be plotted fairly accurately from epigraphic finds, while the extent of a Dilmun state, archaeologically defined, is more uncertain.

Having reached Mesopotamia goods from Dilmun could obviously spread over wider areas of Iraq, Syria and beyond by way of further transit trade, but there is no firm evidence for any direct trade routes between Dilmun and these areas – or is there?

In the early eighteenth century BC the north Mesopotamian king Shamshi-Adad I (c. 1813–1781) created a large but short-lived empire encompassing virtually all of present day northern Iraq and north-eastern Syria (Fig. 1). This empire is best known from the large archives of letters and administrative records found in the city of Mari (Tell Hariri) on the mid-Euphrates, where Shamshi-Adad had installed his son Jasmah-Addu as viceroy (Charpin and Durand 1985). From these archives comes a small group of texts which refer to direct contacts between the kingdom of Shamshi-Adad and Dilmun. These contacts have traditionally been interpreted in the light of the well-known trading activity between Dilmun and Mesopotamia, and it has been assumed that they reflect a pattern of direct

trade between Dilmun and northern Syria (Butz 1983; Potts 1986; Potts 1990: 228ff.). But is this a necessary conclusion to draw from the evidence?

Long-distance trade was a common enough phenomenon in the ancient Near East in this period but generally featured a series of interconnected circuits each more or less monopolized by individual city-states or kingdoms (Larsen 1987). In this context Dilmun seems to have operated as emporium for goods deriving from further down the Gulf and from the Indus area, and as the point of transfer for the import of such goods into southern Mesopotamia, but transport to areas further away is more likely to have belonged to other circuits. Therefore the Mari evidence as hitherto understood seems strangely out of place and invites search for a different interpretation.

The evidence from Mesopotamia

The texts from Mari consist of three letters exchanged between Shamshi-Adad and his son Jasmah-Addu which discuss 'expeditions' and 'envoys' moving between Dilmun, Babylon, Mari and Shubat-Enlil (Tell Leilan), the north Syrian residential city of Shamshi-Adad. In addition to the letters we also have a small administrative note which records an issue of oil sent as a present for the king of Dilmun. This small corpus has recently been re-edited and supplemented with two new letters from the vast number of still unpublished Mari tablets (Groneberg 1992). This allows a closer examination of the evidence, and it appears that all six texts fit into the context of just one single contact between the kingdom of Shamshi-Adad and Dilmun. It follows that the direct contact between Syria and Dilmun could have been incidental and related to a specific event rather than a regular pattern of trade. Letters of this kind are unfortunately rarely dated; thus conclusive proof for such a theory cannot be obtained, but the contents do merge to form a coherent 'story'.

In what we think must be the earliest letter (Groneberg 1992: no. 4) Jasmah-Addu at Mari writes to Babylon to ensure the safe conduct of the 'expedition' which Shamshi-Adad had sent to Dilmun, and which is now returning. The next letter (no. 5) was also sent from Jasmah-Addu, who reports to his father that an 'expedition' has arrived from Dilmun with high-ranking envoys and accompanied by the envoys which Shamshi-Adad had sent to Dilmun. It also provides the information that after these people have rested at Mari, they will proceed to Shubat-Enlil. The remaining letters were sent by Shamshi-Adad, who first complains to his son that a single Dilmun envoy has been left behind at Mari (no. 2), and then relates that the Dilmun envoys will leave Shubat-Enlil and return south via Mari where Jasmah-Addu must supply them with an escort and provisions (no. 3). Finally Shamshi-Adad instructs his son to give the envoys a special, ornate jar with oil for the Dilmun king (no. 6), thus providing a clear link with the administrative note recording an issue of oil for this same king (no. 1).

From this brief review it will readily be apparent that the two texts recently published (5 and 6) provide key information which allows the proposed sequence, while previously the available sources could be interpreted as random documentation of more regular or repeated contact. Another problem in these texts, which has led to confusion, is the correct translation of the word here rendered 'expedition' (*harrānum*), previously

misleadingly translated 'caravan' (so also in Groneberg 1992), a mistake deriving both from the opaqueness of text no. 4 – and from the underlying assumption that trade was involved.

Instead, the whole story seems certain to involve a purely diplomatic event where the word 'expedition' refers to a travelling corps of envoys and their retainers. Unfortunately the texts deal exclusively with the logistics of the diplomatic contact and not with its substance, which could have been, for instance, establishment of a trade agreement. Fortunately, however, the administrative note (no. 1) is dated as was usual, and shows that the texts belong to a very late phase of Shamshi-Adad's reign when he had reached the height of his career. It may be against this background that the contact with Dilmun should be viewed.

In recent years it has become increasingly clear that towards the end of his reign, Shamshi-Adad posed himself as a successor of the immensely successful Old Akkadian kings, who in the late third millennium BC had created the first Mesopotamian empire (Galter 1986). The contact with Dilmun may perhaps be linked to this imperial ideology. In a long official inscription (Grayson 1987: 47ff.) Shamshi-Adad refers to himself as 'king of the universe' and boasts of having received tribute from the kings of Tukrish – a reference to areas to the east of his empire in Iran – and from a 'king of the upper country', i.e. from areas north of the empire perhaps in southern Anatolia. Finally he boasts of having put up his steles in Lebanon in the far west. Thus the information in this inscription brings us to three of the 'four corners of the world' in the Mesopotamian idiom, and from archival texts, mainly those excavated in Mari, it is clear that Shamshi-Adad's boast is based on real events, events which relate to a late phase of his reign (Charpin and Durand 1985: 310–19).

This takes us south to Dilmun, where ideological ambitions may have been a main propellant for diplomatic contacts. By exchanging envoys with the king of Dilmun Shamshi-Adad had reached out to all four corners of the known world and came close to the model set by the Old Akkadian empire-builder Sargon who, among many other things, claimed that 'he made ships from Meluhha (the Indus Valley), Magan (Oman) and Dilmun anchor at the dock of Akkade' (Gelb and Kienast 1990: 163ff.). In this context it is noteworthy that similar contacts with Dilmun kings reappear again in Mesopotamian royal inscriptions only in the first millennium BC, when the most powerful Neo-Assyrian kings, from Sargon through to Assurbanipal (eighth–seventh century BC), all mention tribute sent by Dilmun kings. Shamshi-Adad did not perhaps survive the contact with Dilmun long enough for it to have been mentioned in any of his official inscriptions, but in theory we could expect this to have been planned – as the fulfilment of his claim to be a true successor of Sargon.

If the Mari evidence, then, may not prove the existence of a regular, direct trade between Dilmun and Syria, it cannot be excluded that the contact involved an attempt to establish such a route bypassing pre-existing transit routes. Judging by the absence of further documentation, however, such an effort, if it occurred, would seem to have met with little or very incidental success. Moreover, if Shamshi-Adad's main objective in exchanging envoys with Dilmun was ideological, we must ask what possible gain there was in this for the Dilmunites. Such a question can only be approached if we consider what Dilmun was and what Dilmun society was like at this time.

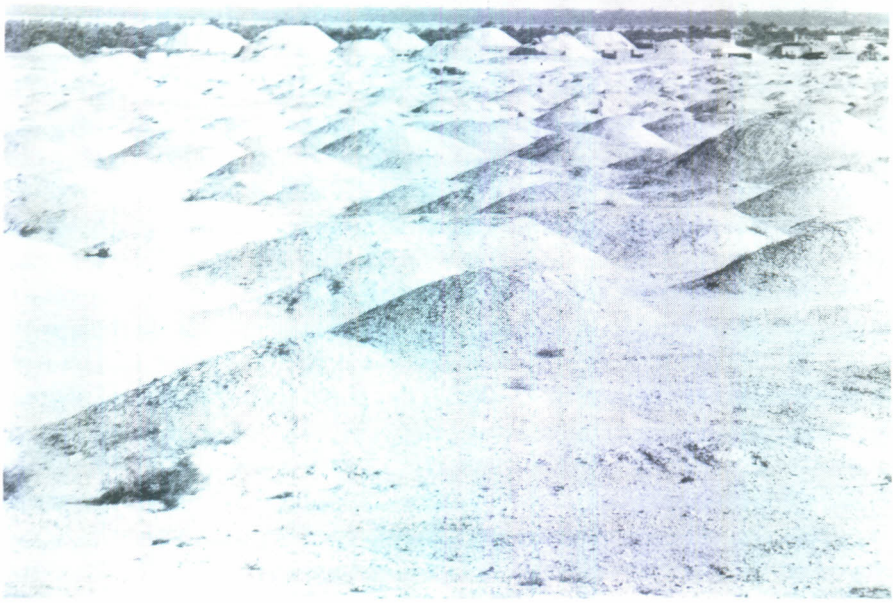

Plate 1 Burial mound field in Bahrain. In foreground normal-sized mounds, in background 'Royal' mounds.

The evidence from Dilmun

Throughout most of the third millennium BC the archaeological evidence from Kuwait, the eastern province of Saudi Arabia and Bahrain presents a very uniform picture: the burial mounds are small and relatively simple; the settlements are small and apparently unfortified; no temples have been discovered; though the area was obviously involved in long-distance trade neither stamp nor cylinder seals were used; kitchen ware was produced in the household, whereas other types of storage vessels and fine wares were imported from Mesopotamia and Oman. Altogether, the archaeological material seems to reflect a rather simple social structure.

In the twenty-first century BC, however, dramatic changes took place. Bahrain now replaced the eastern province of Saudi Arabia as the centre of Dilmun. At Qala^{c}at al-Bahrain, on the northern shore of Bahrain, a small trading station was turned into a city of fifteen hectares, fortified with a stone wall; temples were built at several places in the northern well-watered part of the island; stamp seals came into use; foreign pottery slowly

disappeared and was replaced by newly developed local types manufactured by professional potters; a number of well-defined, bounded burial mound fields containing eventually more than 100,000 mounds were initiated; one of these, situated in the centre of the inhabited part of Bahrain, features a group of gigantic burial mounds up to 25m in height, which must represent a ruling lineage (Plate 1). This complex of new cultural elements continues to characterize Dilmun for several centuries and may be interpreted as the material expression of state formation there (Højlund 1989).

The first phase of the Dilmun kingdom, dated to c. 2050–2000 BC, reveals a considerable influence from the Indus civilization. For instance, when sealing procedures were institutionalized the stamp seal was chosen as in the Indus Valley, instead of the cylinder seal used in Mesopotamia. Moreover, the iconography of the seals shows some similarity with Indus seals. The weight system of Dilmun together with the actual shapes of the weight stones (Bibby 1969: 354) is identical with the Indus system and taken over from there. Indus pottery is not uncommon among the finds from settlements and burials in Bahrain, and local pottery reveals some influence from the Indus, especially in its painted decoration. The only inscribed objects found in Dilmun from this period are stamp seals with Indus script. Two such seals and an Indus grafitto have been found at Qala^{c}at al-Bahrain, and from burials in Bahrain we have two more stamp seals with Indus inscriptions. These seals have been interpreted as belonging to Indus traders residing in Dilmun, but it is perhaps equally likely that in this period the Dilmunites used the Indus script for their own purposes (Højlund, in press).

In the next phase of the Dilmun kingdom, from around 2000 BC, the strong south-eastern impress on Dilmun seems to decrease and is replaced by a north-western influence. This was the period when west-Semitic groups known as Amorites gained political power in Mesopotamia. A number of texts found in southern Mesopotamia now mention Amorite names in relation to Dilmun; such texts often have to do with trade. The cuneiform script is now found in Dilmun, and the few extant inscriptions from both Failaka and Bahrain contain names that are clearly Amorite. The Amorite presence in Dilmun may perhaps be seen in the radical change in stamp seal iconography, which takes place around 2000 BC (Plate 2). The new seal motifs, which reflect rituals and mythological figures, have close parallels in Syria and Anatolia, and this has prompted the suggestion that Dilmun had a relationship, other than one involving trade, with some ethnic element

Plate 2 Dilmun seal from Failaka with offering table above podium, flanked by bull-men.

in Syria (Buchanan 1965: 207; Kjærum 1986: 269, 275). It is not unlikely that it was the Amorites who were responsible for the change in seal iconography, and it seems that Amorites may have gained importance, perhaps even dominance, in Dilmun around 2000 BC, just as they did in the kingdoms of Mesopotamia (Højlund 1989).

Viewed against this background the references in the Mari texts to a Dilmun king seem entirely appropriate. They represent a long awaited textual confirmation of the theory, based on the archaeological finds, that by this time Dilmun was a kingdom. Like other kingdoms in the Near East the Dilmun state may obviously have found it expedient to establish connections with the major political power of the day. For Dilmun the aspect of trade, however, need not have been the main concern.

Conclusion

Our example illustrates the confusion which may arise when complementarity of evidence is not properly exploited. Viewed from Mesopotamia ancient Dilmun appears as a fairly shadowy area known almost exclusively as an important trading centre, and there is a natural tendency to view any contact in this perspective. Gulf archaeologists, on the other hand, operate basically without locally produced written sources in an area where systematic archaeological investigations began only in the 1950s, and results which may coalesce into firmer historical patterns are only now slowly accumulating. In this situation convergence of evidence may be a hindrance rather than a help if the experts only mutually confirm each other's assumptions.

Certainly trade will remain a key-concept for research on Dilmun–Mesopotamian relations, but such research must involve careful evaluation of the changing nature of both Mesopotamian and Gulf societies. The written evidence from Mari apparently fitted nicely into a well-established image of Dilmun as a mere trading centre, but the fact that the documentation can be placed in a specific historical context and appears to relate not to trade but to a diplomatic event has important implications. Not only does it add a significant dimension to our understanding of Dilmun history and society, but it also simultaneously brings the range of imperialist strategies employed by the Mesopotamian monarchs into clearer focus.

Abstract

Eidem, Jesper and Højlund, Flemming

Trade or diplomacy? Assyria and Dilmun in the eighteenth century BC

Dilmun, the ancient name for areas in eastern Arabia, is primarily known from cuneiform sources found in Mesopotamia which document Dilmun's pre-eminent role as trading and transit centre. Given the paucity of written evidence from Dilmun itself scholars have tended to view its history exclusively in terms of the Mesopotamian sources. This paper examines briefly one example where such sources may have been misinterpreted and suggests an alternative solution based on both the written Mesopotamian evidence and archaeological data from Dilmun.

SEA PEOPLES IN ETRURIA? ITALIAN CONTACTS WITH THE EASTERN MEDITERRANEAN IN THE LATE BRONZE AGE

ROBERT H. TYKOT

The origin of the Etruscans has been debated ever since the fifth century B.C. when Herodotus,[1] citing Lydian sources, attributed them to that region of Asia Minor:

> Atys divided the population into two groups and determined by drawing lots which should emigrate and which should remain at home. He appointed himself to rule the section whose lot determined that they should remain, and his son Tyrrhenus to command the emigrants. The lots were drawn, and one section went down to the coast at Smyrna, where they built vessels, put aboard all their household effects and sailed in search of a livelihood elsewhere. They passed many countries and finally reached Umbria in the north of Italy, where they settled and still live to this day. Here they changed their name from Lydians to Tyrrhenians after the king's son Tyrrhenus, who was their leader.

The Greek historian Hellanicus, quoted by Dionysius of Halicarnassus,[2] also claimed an eastern Mediterranean origin for the Etruscans, stating they were the Pelasgians, who settled the Aegean islands of Lemnos and Imbros. Some weight must be given to this argument since a sixth-century B.C. funerary stele, now in the Athens National Museum, and locally made pottery sherds have been found on Lemnos, all with inscriptions in a dialect similar to Etruscan.[3] This evidence, however, may only demonstrate the independent survival of a common pre-Indo-European language.

Most modern scholars reject these "histories" as completely fictitious, as another example of the Greeks' passion for allotting imaginary origins to peoples and cities.[4] In fact, Dionysius, writing in the first century B.C., informs us of a contemporary of Herodotus, the Lydian historian Xanthus, who claimed that the first man on earth had been a Lydian, that his descendants reigned long before

the time of Heracles, and that numerous towns in Asia were founded by Lydians. Given these fantastical foundation myths, it seems plausible that the superficial etymological similarity between the Lydian town Tyrrha, and Tyrrhenia, was the provocation for the foundation myth heard by Herodotus.[5] Other Lydian sources indicate that Tyrrha may have been founded by King Gyges, who named it after a son of the legendary King Atys.[6] Since Gyges ruled in the seventh century B.C., it would seem that the Etruscans could not have come from a Lydian town founded two or more centuries after they were already established in Italy. Finally, Dionysius states that the Etruscans he consulted considered themselves autochthonous and called themselves Rasenna, not Tyrrhenians.

A more recently proposed eastern Mediterranean ancestry for the Etruscans would have them related to the tribe of Sea Peoples identified in Egyptian reliefs and documents as *Trš* (Teresh).[7] The tribes of *Šrdn* (Sherden), *Škrš* (Shekelesh), and *Tkr* (Tjeker) have likewise been identified for etymological reasons with the islands of Sardinia and Sicily. Furthermore, archaeological evidence leaves no doubt that contacts did exist between the eastern and western Mediterranean in the Late Bronze Age, thus raising the possibility

Table 1 Chronology of the Eastern Mediterranean and the Tyrrhenian Region

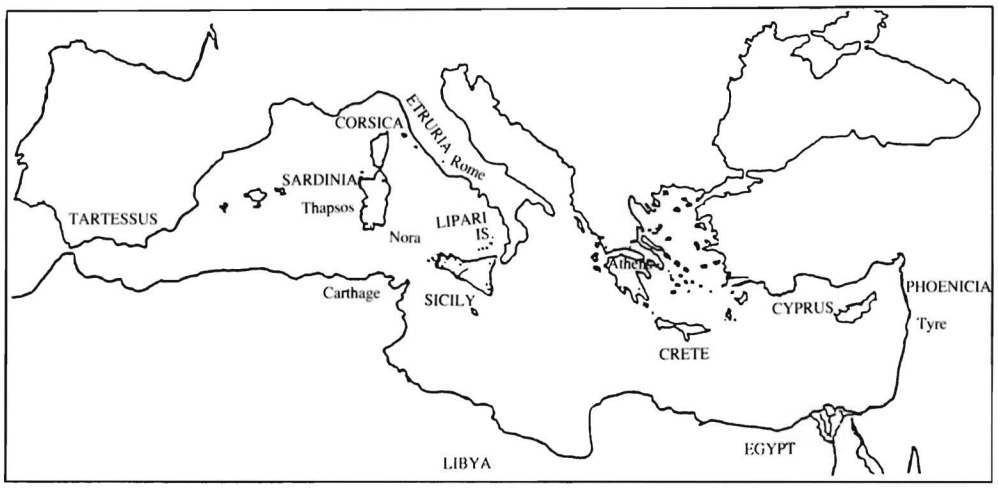

Fig. 1. Mediterranean sites mentioned in the text.

that some of the tribes of Sea Peoples mentioned in the Egyptian documents of Ramses II, Merneptah, and Ramesses III could have settled in the Tyrrhenian region before the emergence of the Etruscan civilization (see table 1 and fig. 1).

Even in the unlikely event of scholarly agreement on the etymological validity of this theory, however, *archaeological* evidence is required to demonstrate the nature of the relationship between these regions and to establish a context in which these etymological derivations can reasonably be explained.

Certainly, there was no wholesale migration between the regions involved, either at the time of the Sea Peoples' raids on Egypt in the thirteenth and twelfth centuries B.C., or any time prior to the emergence of the Etruscan civilization in the eighth century B.C. All of the archaeological data indicate that the Etruscans were the descendants of indigenous peoples, the Villanovans and Proto-Villanovans, who themselves were descendants of the Apennine peoples living in Middle-Late Bronze Age Italy.[8]

This is not to say, however, that the Etruscans and their predecessors were isolated in any way from their cultural contemporaries; on the contrary, Etruscan art seems to owe much to the influence of Greek and Near Eastern cultures. But despite intense interactions with outside groups, the Etruscans were not dependent on external stimuli for their own political and social development.

I would suggest nevertheless that, potentially, the settlement in Etruria of relatively small numbers of the Teresh tribe of the Sea Peoples could have culminated in the adoption of their name for that region. After a review of the textual evidence, I will present the archaeological data for contact between Italy and the eastern Mediterranean in the Late Bronze and Early Iron Ages so that we may critically evaluate this hypothesis.

AMARNA PERIOD

Our earliest knowledge of the "Sea Peoples" comes from the Amarna letters, where the Sherden are listed as mercenaries stationed in the Levant at Egyptian garrisons such as Beth-Shan and Lachish. Although Akhenaten reigned at Amarna from about 1352 to 1336 according to the low chronology, garrison sites in the Levant date back to the conquests of Tuthmosis III in the mid-fifteenth century B.C. and continue up to the reign of Ramesses III in the early twelfth century B.C.

RAMESSES II

The Sherden are first described as *sea*-going in the fragmentary Tanis stele, which dates to the early part of Ramesses II's reign (1279–1213): "Shardana, rebellious of heart . . . and their battleships in the midst of the sea." Ramses II "destroyed warriors of the Great Green [the Mediterranean], and lower Egypt spends the night sleeping peacefully."[9]

A few years later the Sherden are again mentioned as mercenaries, fighting at the Battle of Kadesh. The Egyptian-Hittite hostilities began in year 5 of Ramesses' reign, with a treaty signed in year 21 (approximately 1275 to 1258 B.C.). The Battle of Kadesh is depicted on numerous Egyptian reliefs. The Poem of Pentaur (on temple walls at Luxor, Karnak and Abydos) describes the preparations of the Egyptians and their march to northern Syria: "Behold, his majesty prepared his infantry and his chariotry, the Sherden (*S-r-dy-n*) of the captivity of his majestry from the victories of his sword—they gave the plan of battle . . ."[10]

UGARITIC AND HITTITE DOCUMENTS

Sherden mercenaries were also employed by the king of Ugarit in the mid-13th century B.C. Liverani was the first to equate the Egyptian *šrdn* with the *trtnm* of the Ugaritic texts, while the role of the Sherden in Ugarit has been discussed by Dietrich and Loretz, Liverani, and most recently by Heltzer.[11] The first text (PRU III.16.251) is written in the reign of Niqmepa, while the second (PRU III.15.118) and third (PRU III.15) come from the reign of his son Ammistamru II, both ruling in the mid-13th century B.C.:

> From the present day, Niqmepa, son of Niqmaddu, king of Ugarit, took the fields of Allan, the Sherdanu, in the (village) Ilu'istam'i, and the fields of his inheritance (?) and gave it to Sawittenu. And Sawittenu shall honour the king, his lord, with 100 (shekels) of gold.

> Nobody shall take it from his hands. The seal of the great king. Witness, Samas-sarru, the scribe.

> From the present day, Ammistamru, son of Niqmepa, king of Ugarit, took the fields of Allan, the Sherdanu with its vineyard, in the (village) Mati'ilu and gave it to Ibsali and Ibsali [x (shekels) of silver (?)] shall give to the [king]. In the future nobody [ ] shall take it from Ibsali. The seal of the king Ammistamru, son of Niqmepa. Witness—Iasiru, the scribe.

> [and next: the house] and the salt-producing field [of] IM, son of the sherdana, Kurwanu bought [for x hund]red (shekels) of silver. This field [of] Kurwanu will be forever.[12]

Other texts show that some of the Sherden had west-Semitic names (PRU IV:17.112), and served in the military forces at the royal palace (PRU II.28–31, KTU 4.174). Since their number is 5, 4, 5, 5 and 5, this indicates that the real number of Sherdana in Ugarit was not large.[13] Yet another text (PRU II.124) lists men receiving or delivering an *utpt sărdnnm*, translated as a "quiver of the sherdana."[14] Although we have no evidence of the Sherden using a special type of quiver, both the Egyptian reliefs, and many Sardinian figurines, demonstrate the use of the bow and arrow.

The Ugaritic texts demonstrate that some Sherden were landowners in or around Ugarit, but that their fields were subsequently sold by the king of Ugarit. It is possible that these fields were grants for military service to the king.

Our earliest knowledge of the Teresh comes from a Hittite text of Tudkhaliya IV, which refers to *Ta-ru-i-sa*, located near the Troad.[15] The text is not very specific, and we can only speculate on the potential relationship between this place and the Tyrrha of Lydian date mentioned above. Other Hittite documents including the Tawagalawas Letter and the Madduwattas Indictment tell of general unrest in Miletus/Ahhiyawa and the Lukka lands in western Anatolia during the 13th century B.C., events which may be the precursors to the raids of the Sea Peoples on Egypt.[16]

A letter from the Hittite king to an official of Hammurabi, the last king of Ugarit, is further evidence of concern over the Sea Peoples (RS 34.129):

> From the Sun, the Great King, to the city-prefect: Now, with you, the king, your master, is young. He doesn't know anything. I have (already) given orders to him regarding Lunadusu, who was taken captive by the Sikalayu, who live on ships. Now I have sent to you Nisahili, one of my administrative officials, with instructions. As for you, send Lunadusu, whom the Sikalayu captured, here to me. I will ask him about the Sikala-affair. Then he can return to Ugarit.[17]

Apparently Lunadusu, as a prisoner aboard their ships, might be able to provide information about the Sikala (*Si-ka-la-liu-a*).[18] Importantly, Rainey[19] has now identified the Sikalayu of this Akkadian script with the Tjeker/Thekel of the Egyptian inscriptions,

Brought to you by | New York University Elmer Holmes Bobst Library

Download Date | 10/19/14 5:11 PM

rather than with the Shekelesh as Lehmann[20] did. In fact, Tjeker is a poor transliteration, and should be Sikel, as Breasted[21] suggested long ago.

Correspondence between the same Ugaritic official and the King of Alashiya (Cyprus) also tells of raids by an unidentified enemy.[22] Sandars has correlated the events of these texts with the sea battle of Suppiluliumas II, the last king of Hatti, and makes them contemporary with Ramesses III's northern war (ca. 1175 B.C.). The Ugarit-Alashiya correspondence could, however, relate to the first arrival of the Sea Peoples during Merneptah's reign, about 1207 B.C. Indeed, the chronological correlation of kings, pharaohs, textual events and actual destruction levels is a major problem.[23]

MERNEPTAH

Merneptah (1212–1202 B.C.), in the fifth year of his reign, repelled an invasion of Libyans and their allies in the western Delta. These allies of the Libyans included the Teresh, Shekelesh, and the Sherden, previously known only as mercenaries fighting for Egypt, while the Sikala/Sikels/Tjeker are not listed. The Great Karnak Inscription begins ". . . Ekwesh, Teresh, Luka, Sherden, Shekelesh, Northerners coming from all lands"[24] and continues:

> The wretched, fallen chief of Libya, Meryey, son of Ded, has fallen upon the country of Tehenu with his bowmen—Sherden, Shekelesh, Ekwesh, Luka, Teresh, taking the best of every warrior and every man of war of his country. He has brought his wife and his children—leaders of the camp, and he has reached the western boundary in the fields of Perire.[25]

The invaders were badly defeated in a six-hour battle, with 6,359 Libyans slain, along with 222 Shekelesh, 742 Teresh, and an unknown number of Sherden and Ekwesh.[26] The Israel Stele, in celebrating this victory, mentions that Merneptah campaigned in Palestine, plundering Pekanan, carrying off Askalon, and seizing Gezer.[27] Are these places where the allies fled after their defeat?

RAMESSES III

The Sikala/Sikels/Tjeker make their first appearance in the first Libyan War of Ramesses III (year 5), and are identified as northerners like the Teresh, Sherden, and Shekelesh: "The northern countries are unquiet in their limbs, even the Peleset, the Thekel, who devastate their land. Their soul came, in the last extremity. They were warriors upon land, also in the sea."[28] Once again, the Libyans and their allies are defeated, with over 12,000 men slain and 1,000 taken captive.[29]

Another clash between the Egyptians and the Sea Peoples came

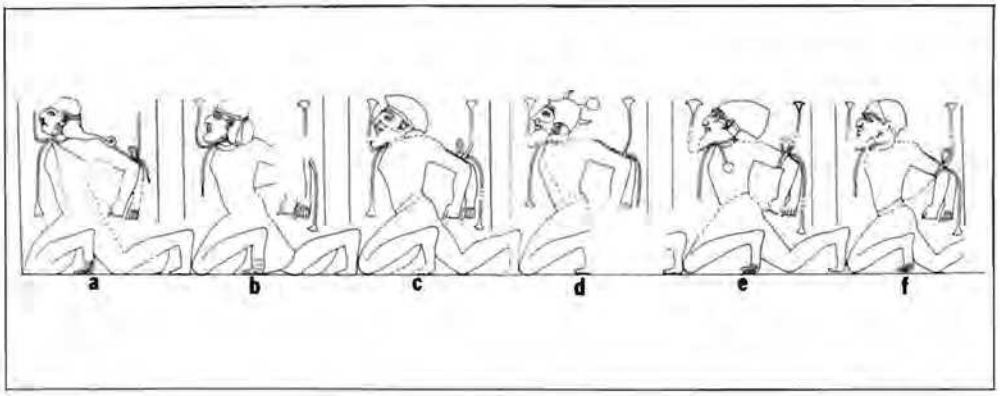

Fig. 2. Captive chieftains on a relief at Medinet Habu: (a) Hittite; (b) Amorite; (c) Tjeker; (d) Shardana; (e) Shasu or Shekelesh; (f) Teresh.

during Ramesses III's eighth year, when the pharaoh's forces defeated the marauders in both a land and sea battle, either somewhere on the Phoenician coast, or as Sandars feels, closer to the Delta.[30] Although neither the Teresh nor the Sherden are mentioned in the reliefs, the Sea Peoples again came from the north:

> Not one stood before their hands; from Kheta, Kode, Carchemish, Arvad, Alasa, they were wasted. They [set up] a camp in one place in Amor. They desolated his people and his land like that which is not. They came with fire prepared before them, forward to Egypt. Their main support was Peleset, Thekel, Shekelesh, Denyen, and Weshesh; (these) lands were united, and they laid their hands upon the land as far as the Circle of the Earth. Their hearts were confident, full of their plans.[31]

The Sherden are mentioned, however, in the Papyrus Harris, as allies of the invaders:

> I extended all the boundaries of Egypt; I overthrew those who invaded them from their lands. I slew the Denyen in their isles, the Thekel and the Peleset were made ashes. The Sherden and the Weshesh of the sea, they were made as those that exist not, taken captive at one time, brought as captives to Egypt, like the sand of the shore. I settled them in strongholds, bound in my name. Numerous were their classes like hundred-thousands. I taxed them all, in clothing and grain from the storehouses and granaries each year.[32]

The Teresh, Sherden, and Thekel, as well as the Kheta (Hittites), Amor, Shasu(?) and Peleset(?) are also present in the Medinet Habu relief, which commemorates Ramesses III's Amorite War by showing these seven captive chiefs kneeling with their arms tied behind their backs (fig. 2).[33]

It seems clear that Ramesses III made use of these conquered peoples just as his predecessors had: "I made Egypt into many classes, consisting of: butlers of the palace, great princes, numerous infan-

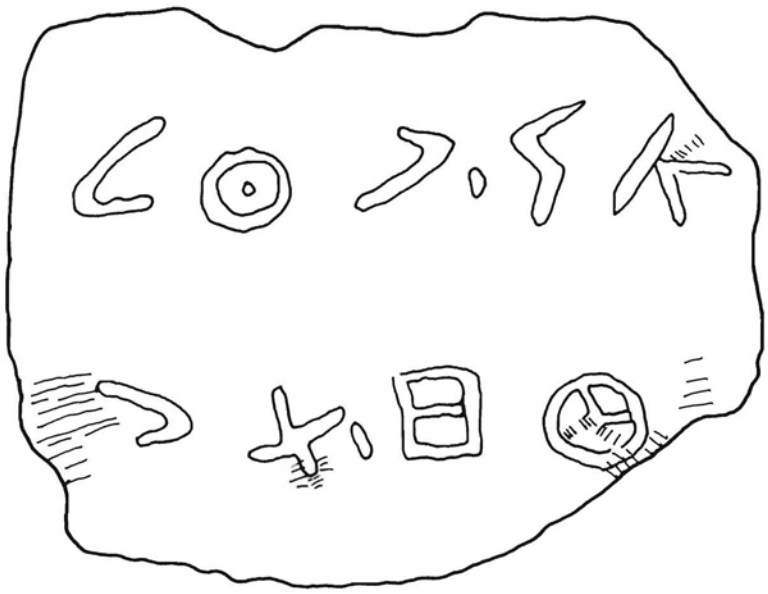

Fig. 3a. The Nora Fragment. Cagliari, Museo Archeologico Nazionale.

try, and chariotry, by the hundred-thousand; Sherden, and Kehek, without number; attendants by the ten-thousand; and serf-laborers of Egypt."[34] Furthermore, the Egyptians were familiar with these people, who were probably living in the Levant, a region of great political and economic importance to Egypt:

> the Sherden and Kehek were in their towns, lying the [length] of their backs; they had no fear, (for) there was no enemy from Kush, (nor) foe from Syria. Their bows and their weapons reposed in their magazines, while they were satisfied and drunk with joy. Their wives were with them, their children at their side; they looked not behind them, (but) their hearts were confident, (for) I was with them as the defense and protection of their limbs. I sustained alive the whole land, whether foreigners, (common) folk, citizens, or people, male or female.[35]

WENAMON AND AMENOPE

That the Levant was the home of at least some of the Sea Peoples is confirmed by the *Tale of Wenamon*, who was sent to Byblos to acquire timber at the end of the twentieth dynasty (ca. 1070 B.C.). His payment of gold and silver was stolen while he was at Dor, which was then a petty kingdom of the Thekel: "I arrived at Dor, a city of Thekel, and Bedel, its king, caused to be brought for me much bread, a jar of wine, and a joint of beef."[36] Although Wenamon did recover some of the silver, the Thekel followed him to Byblos:

Brought to you by | New York University Elmer Holmes Bobst Library
Authenticated
Download Date | 10/19/14 5:11 PM

> [Wenamon] spied eleven ships coming from the sea, belonging to the Thekel, saying: "Arrest him! Let not a ship of his (pass) to Egypt!" I sat down and began to weep. The letter-scribe of the prince came out to me, and said to me: "What is the matter with thee?" I said to him: "Surely thou seest these birds which twice descend upon Egypt. Behold them! They come to the pool, and how long shall I be here, forsaken? For thou seest surely those who come to arrest me again."[37]

Wenamon clearly associates these Thekel from Dor with those who fought Egypt twice before, during the reigns of Merneptah (although we have no surviving documents naming them) and Ramesses III.[38]

The *Onomasticon* of Amenope, also from the early eleventh century B.C., refers to towns and peoples in Canaan, listing from north to south the Šardina, Seqila and Pelastu.[39] Since we know the *Pelastu* (= Peleset/Philistines) settled mostly along the southern coast, and the *Seqila* (= Thekel/Tjeker/Sikala/Sikels) were living around Dor, the Šardina must have lived somewhere between Mt. Carmel and Tyre, perhaps at Akko.[40]

Fig. 3b. The Nora Stone. Cagliari, Museo Archeologico Nazionale.

PHOENICIANS

The inscription known as the Nora Fragment (fig. 3a), found in the sea near Nora in Sardinia, has been dated to the mid-eleventh century B.C. on the basis of paleographic examination.[41] If one assumes that it was brought to Nora soon after its manufacture, it indicates that by the mid-eleventh century B.C., the Levantine people called Phoenicians, known earlier as Canaanites, were plying the waters of the western Mediterranean. Although the earliest archaeological evidence of Phoenician settlement in Sardinia, at Pithekoussai on Ischia, at Carthage, and in Spain, comes from the early eighth century B.C., it is certainly possible that the Phoenicians were *travelling* in western Mediterranean waters some two to three centuries before their actual *colonization* of the west.

The Nora Stone (fig. 3b), also found in the sea, has been dated to the second half of the ninth century B.C. and thus does not predate Phoenician settlement on Sardinia.[42] It clearly links, however, the island with the Šardina of the *Onomasticon*, and is therefore fundamental to the hypothesis that Sardinia did derive its name from the tribe of Sea Peoples known as Sherden: ". . . at Tarsis, and he drove them out. Among the Šardina he is [now] at peace, (and) his army is at peace: Milkaton son of Subna, general of (king) Pummay."[43] A slightly different reading of the Nora Stone had been made by Peckham,[44] who translated the text as follows: "From Tarshish he was driven; in Sardinia he found refuge; his forces found refuge: Milkuton, son of Subon, the commander. To [the god] Pmy." Cross, however, has convincingly demonstrated that the eighth line

Brought to you by | New York University Elmer Holmes Bobst Library
Authenticated
Download Date | 10/19/14 5:11 PM

of the text, *lpmy*, must be Pummay (Pygmalion), king of Tyre, and that Milkuton "drove them out" (active voice) rather than "he was driven."[45]

Cross interprets the inscription as part of a victory stele, and suggests that it could have begun "He fought with the Sardinians. . . ." Similarly, he feels that "Tarsis is most easily understood as the name of a refinery town in Sardinia, presumably Nora or an ancient site nearby.[46] The stele thus celebrates the victory of Phoenician forces over native tribesmen in the 'battle of Tarsis.'" Pygmalion was in fact king of Tyre from about 831–785 B.C., a date in agreement with Cross' reading of the paleographic evidence. Cross concludes that Phoenician military forces were in Sardinia, sent from Tyre, perhaps to protect colonizing merchants or metal workers.[47]

Given the fragmentary nature of the Nora Stone, it is a large leap to the conclusion that there existed in Sardinia a place called Tarsis, where a battle worthy of documentary commemoration occurred. Alternatively, Tarsis/Tarshish could refer to either the Tarsus of Cilicia, with which the Phoenicians were certainly familiar, or Tartessos in Spain, well known from Greek literary sources as a Phoenician trading-post where copper and tin were acquired.[48] In either case, the Nora Stone places the Phoenicians of Tyre, among whom the Šardina were settled in the eleventh century B.C., on the island of Sardinia, some two centuries later. Furthermore, the translations of both Cross and Peckham suggest that *the Phoenicians identified the island as 'Sardinia' by the ninth century* B.C.

The two possibilities that exist to explain the island being known as Sardinia are: (1) it is the name given to the island by the indigenous Nuragic peoples among whom the Phoenicians settled; or (2) it is the name given to the island by the Phoenicians or other foreigners who travelled and/or settled there. It follows then: (1) and (2a) that either the name Sardinia is only coincidentally similar to Sherden/Šardina, or (2b) that the island could have been named after the Šardina. It is not hard to imagine foreigners (Phoenicians) naming an island for a group of people (Šardina) with whom they were familiar and who had settled there.

The second part of this paper will examine the *archaeological* evidence for interaction between Italy, especially Etruria, and the eastern Mediterranean in the Mycenaean and Phoenician periods. This data will demonstrate that the Italian regions were in touch with the Aegean and the Levant at a time when the Sea Peoples were active, and that if certain tribes travelled to the west, they were not the first easterners to do so. Likewise, the archaeological data from Etruria will be examined so as to evaluate the circumstances under which it could have received its name from the Teresh, as has been suggested for Sardinia and the Sherden/Šardina.

Archaeometallurgical Evidence

Perhaps the strongest link between the Tyrrhenian regions and the eastern Mediterranean has been the number of findspots (22) in Sardinia with either complete or fragmentary oxhide ingots.[49] These ingots are well known from New Kingdom Egyptian reliefs, including those of Ramesses III at Medinet Habu, and from the spectacular finds of the Cape Gelidonya and Ulu Burun shipwrecks.[50] Although Sardinia's wealth of copper and lead/silver ores maintains the possibility that the ingots were locally made according to eastern Mediterranean specifications,[51] recent lead isotope analyses suggest that all the Sardinian oxhide ingots are made of Cypriot copper.[52]

Other Sardinian artifacts, including 10 bronzes of Cypriot style, appear, however, to have been made of copper from the Iglesiente/Sulcis district in southwest Sardinia.[53] It is important to note, though, that most of the Cypriot-influenced material, including the Sardinian figurines, dates to the twelfth and eleventh centuries B.C. or later, postdating the widespread destructions in the eastern Mediterranean, and demonstrating continuity in east-west contacts while Greece was in the Dark Age.[54] Furthermore, many of the oxhide ingot fragments in Sardinia actually come from Early Iron Age, rather than Late Bronze Age contexts.[55]

While metal objects of Cypriot or Aegean influence, including swords, daggers, and tripods, have also been found in Sicily and in mainland Italy, their numbers are not nearly as extensive as for Sardinia.[56] An anchor of Cypriot type, found near the mouth of the Tiber and made of local volcanic rock, nevertheless adds to the suggestive evidence for eastern Mediterranean peoples sailing in the Tyrrhenian by the end of the second millennium B.C.[57]

Ceramic Evidence

The large number of sites in the western Mediterranean at which Mycenaean pottery has been found provides a second corpus of evidence for east-west contact in the Late Bronze Age. Mycenaean pottery has been found in Sardinia, Sicily and mainland Italy, Malta, and even Spain, ranging from a few sherds of LH I-II (perhaps even some late MH wares) to much greater quantities of LH IIIB and IIIC.[58] The use at some of these sites of Aegean-style cooking pots and *ceramica grigia*, in forms complementing the Aegean-type vessels and the local impasto wares, may even indicate the actual presence of easterners.[59]

The greatest density of Mycenaean finds comes from that part of Italy closest to Greece and the Aegean world, the regions adja-

Brought to you by | New York University Elmer Holmes Bobst Library

Download Date | 10/19/14 5:11 PM

cent to the Gulf of Taranto. Mycenaean pottery has been found at 29 sites in Apulia, Basilicata and Calabria, but only 6 with more than a dozen sherds (see table 2).[60] In Sicily and the Aeolian Islands, guarding the eastern entrance to the Tyrrhenian, only 17 sites with Mycenaean pottery are known, and only three with significant quantities. After one ventures into the Tyrrhenian, the number of sites with Mycenaean finds drops considerably. In the fertile region of Campania, only six sites have Mycenaean products. In Sardinia, only one of eight sites with Mycenaean pottery has more than five sherds, and but two sherds (one IIIA, the other IIIB) have been found in Spain.

Some of the ceramics from these sites have been chemically analyzed to determine their provenience, as indicated in the last column of table 2. While the analyses indicate that both imported and locally produced imitations of LHIIIA, LHIIIB and LHIIIC pottery are present, they further demonstrate that many of the imported wares were actually made in Rhodes or Cyprus rather than the Peloponnesus.[61] The identification of the items on board the Cape Gelidonya and Ulu Burun ships as Cypriot or Syro-Palestinian is a further indication that Cypriots or Canaanites, rather than Mycenaeans, were travelling in the west.[62]

Continued contact with the Aegean and eastern Mediterranean after the destructions of the early twelfth century is indicated by the Cypriot metalwork discussed above, and the presence of *imported* LHIIIC wares, which in the Levant are always locally produced by new settlers identified as Sea Peoples. The finds of Proto-Geometric pottery at the Gulf of Taranto sites long before the Greek period of colonization would seem to suggest a continuing interactive relationship begun in the Late Bronze Age, as does a Sardinian geometric askos found at Khaniale Tekke near Knossos.[63]

Etrurian Sites with Aegean Artifacts

In contrast to southern Italy, Sicily and Sardinia, where at least one site has enough Mycenaean material to suppose that an eastern Mediterranean ship stopped there, only four sites with Aegean ceramics are known in Etruria, none with more than five sherds. Even the Piediluco and Contigliano hoards contain only a few objects of eastern origin.

At Luni sul Mignone (Blera, Viterbo) (fig. 4, no. 3) five pieces of Mycenaean pottery were found in pure Apennine levels at an acropolis site continuously inhabited from the Middle to the Final Bronze Age. Four are from closed vessels and one from a cup or bowl. One is LHIIIA/B, two LHIIIB, and two LHIIIC.[64]

A single sherd of Mycenaean IIIC:2 pottery has been found along with Subapennine pottery at Monte Rovello (Allumiere, Roma)

(fig. 4, no. 5), about 5 km. closer to the coast than Luni sul Mignone.[65] The fragment, from the shoulder of a large vase, is small and poorly preserved, and was decorated with a faint net pattern motif. It has been identified as late LHIIIB to mature LHIIIC by Vagnetti[66] although it was originally identified by Toti[67] as LHIIIC:2 or Submycenaean.

San Giovenale (Blera, Viterbo) (fig. 4, no. 4), located near both Monte Rovello and Luni sul Mignone, has a long sequence of occupation through the Apennine, Subapennine, Protovillanovan and Etruscan periods. Malcus[68] states that the single vase fragment, decorated with a spiral motif, was ascribed by Furumark to LHIIIB, although Vagnetti[69] describes it as provincial Mycenaean IIIC.

A single sherd of LHIIIC has also been found at the Etruscan site of Telamone (fig. 4, no. 2) located on the coast near Grosseto.[70]

Some sherds in the back-fill near the archaic temple at Sant'Omobono in Rome, found along with Protovillanovan through sixth century B.C. material, were originally thought to be LHIIIC.[71] Vagnetti[72] has examined these sherds, however, and concluded that they are actually Geometric.

The only other Aegean artifacts found in Etruria come from Piediluco (Terni, Umbria) (fig. 4, no. 6), the probable origin of the Contigliano hoard as well.[73] Among the 116 bronze pieces, all broken, are a fragment of a Cypriot tripod from Piediluco, possibly datable between the twelfth and first half of the eleventh century B.C.; another tripod fragment typologically identical to the first from the Contigliano hoard; a four-spoked wheel, probably from a wheeled stand and very common on Cyprus in this period; and a fragment of a cauldron with a circular handle, of a type known in Crete and mainland Greece in the LBA. Another tripod fragment was bought at Piediluco and is now in the Danish National Museum.[74] Significantly, the other objects in both hoards are not earlier than the tenth century B.C., and considering that the material is mostly scrap, the Aegean objects could have been used and broken elsewhere and subsequently circulated for remelting.[75]

Discussion

There is clearly quite a bit of evidence for east-west contact in the Late Bronze Age. The more finely dated ceramics demonstrate that these contacts had begun by the very beginning of the period, while the metallurgical evidence suggests that they continued in the last centuries of the second millennium B.C. It is clear also that Phoenician activities in the west had begun by the very beginning of the first millennium, and continue what must have been more or less continuous relations between east and west.

In addition to strictly Mycenaean products, pottery from Crete, Rhodes and Cyprus also made its way to the west. The metallurgical link, in the form of oxhide ingots, bronze tripods and bronze figurines, is also with Cyprus and Phoenicia rather than the Peloponnesus. Some impasto finds at Chania and Kommos in Crete, an Italian sword from the Ulu Burun shipwreck, and a few scattered daggers and fibulae of possible Italian origin, represent the Aegean end of what is mostly an asymmetrical relationship between the eastern and western Mediterranean.[76]

The earliest imported pottery in the west comes mainly from Vivara and Lipari, both islands strategically located: Vivara at the entrance to the Bay of Naples, and Lipari as a crossroads near the

Brought to you by | New York University Elmer Holmes Bobst Library
Authenticated
Download Date | 10/19/14 5:11 PM

eastern entrance to the Tyrrhenian Sea. Although chemically untested, much of the Mycenaean material at these two sites appears to be imported. The imported coarse wares documented at Vivara are strong evidence for eastern Mediterranean ships stopping there.

Beginning with the LHIIIA period, concentrations of Aegean-type pottery appear at Thapsos in Sicily, and at the Gulf of Taranto sites of Scoglio del Tonno and Broglio di Trebisacce. It appears that Broglio differs from the other three sites in that most of the Aegean-type material was locally produced. In the LHIIIB period, Antigori in Sardinia, and Termitito on the Gulf become major centers of eastern Mediterranean activity, while contacts with Vivara ceased. The material from Termitito, like that at Broglio, is apparently of local manufacture, while both imported pottery and provincial imitations are well represented at Antigori.

During the LHIIIC period local production continued at Broglio, Termitito, and Antigori, while imports continued at Scoglio, Lipari, and Antigori. Very little material from this period has been found in Sicily. Given that the number of pottery analyses for a given period at each of these sites is not very large (except for Antigori), it seems nevertheless that there was no change in production pattern between the LHIIIB and LHIIIC periods, nothing to correlate with the destructions in the eastern Mediterranean. The continued importation of Aegean pottery in the LHIIIC period strongly suggests that the economic relationship between the Aegean and the west differed from that between the Aegean and the Levant.

In the Levant, the presence of LHIIIC pottery, always locally made, is taken to indicate the settlement of Sea Peoples after their forays into Egypt during the reign of Ramesses III. The Sea Peoples are thought to have arrived in the Levant already familiar with Mycenaean type pottery, from which they derived a monochrome and later a bichrome decorative style; trade relations with the Aegean declined. The presence of locally produced LHIIIC pottery at western Mediterranean sites cannot be interpreted in the same manner because importation continued at major sites.

An interesting question is what the potters at Broglio and Termitito used as stylistic models for their (mostly) local Mycenaean-type vessels. The limitations of archaeological sampling, both in the field and in the laboratory, along with the inherent problems of identifying undecorated sherds, may be exaggerating the differences between the assemblages from Scoglio and those from Broglio and Termitito, but an explanation seems warranted. Some might suggest that there was an Aegean segment to the population at these sites, but it is more likely that local potters were acquainted with imported wares, which were certainly abundant across the Gulf at Scoglio del Tonno. It is possible that Scoglio was the major Aegean port-of-call in the Gulf of Taranto and that demand for Aegean-type pottery grew in the region, stimulating local imitation at nearby settlements.

Conclusion

It is a reasonable *hypothesis* that there is a definite relationship between the Sherden of the Ugaritic and Egyptian texts and the island of Sardinia. It seems unlikely that the Sherden came from Sardinia because (1) they are a known entity in the Amarna letters, written in a period (LHIIIA) for which there is no evidence of Mycenaean contact with Sardinia (LHIIIB and LHIIIC); (2) their presence in Ugarit (thirteenth century) and near Tyre (1100 B.C.) argues for an eastern Mediterranean origin, as does (3) their association with other Sea Peoples, "northerners coming from all lands."

Whatever their origin, it is clear from the archaeological evidence, the *Tale of Wenamon*, and the *Onomasticon* of Amenope, that Sea Peoples settled in the Levant, at least the Peleset, the Sikels and the Šardina. Given the Sardinian finds of late Cypriot bronzes, possibly leftover oxhide ingots, the figurines with Cypriot and Phoenician affinities, and the knowledge that Phoenicians were sailing in the western Mediterranean by the eleventh century B.C., it is possible that some Šardina from near Tyre emigrated to Sardinia sometime between 1100 and 800 B.C., settling at the major Phoenician sites such as Nora, Tharros, Sulcis and Cagliari. In this manner these colonists could have given their name to the entire island, a name imposed on the indigenous inhabitants by a commercially-active people with a written language, and one that survived into the historical period. It is noteworthy that the modern name of the island is *not* related to what the Greeks called Sardinia: *Ichnussa*, which means footprint.

A similar scenario could be drawn for Sikels living at Dor, and emigrating to Sicily, but other than the Phoenician colonization of the island in the eighth century B.C., and the obvious phonetic relationship, we cannot suggest such a particular affiliation without any textual evidence. The quantity of Mycenaean pottery, even at Thapsos, does not indicate that non-Sicilians lived there, nor is there the abundant evidence for LHIIIC and twelfth-to-eleventh-century B.C. contact that there is for Sardinia; these situations result in a 300-year gap between the last mention of the Sikels and the earliest Phoenician presence in Sicily.

As for the Teresh, there is no textual documentation of where they settled after their battle with Ramesses III. It is quite improbable that they settled in Etruria in the twelfth century B.C., as there is no evidence of *direct* contact between the eastern Mediterranean and that region before the ninth century B.C. The few sherds and metal artifacts of eastern Mediterranean origin could easily be the result of down-the-line exchange, perhaps all the way from the Gulf of Taranto. Without an idea where the Teresh were between the twelfth and eighth centuries B.C. it is impossible to even formulate a hypothesis regarding how they could have lent their name, even

Brought to you by | New York University Elmer Holmes Bobst Library
Authenticated
Download Date | 10/19/14 5:11 PM

through Greek intermediaries, to the people of Etruria, who called themselves Rasenna.

What is certain is that a migration or invasion of the scale envisioned by Greek and Roman historians is not supported by any archaeological evidence; if even a small number of easterners settled in Etruria during the ninth to seventh centuries B.C., they did not distinctly alter the indigenous, gradual, cultural development begun in the Late Bronze Age. In fact, the Etruscans themselves considered their first *saeculum* to have started in the eleventh or tenth century.[77]

In this paper I have tried to present the textual and archaeological evidence relevant to the etymology of the Tyrrhenian regions of Etruria, Sardinia and Sicily. Although the region in general was undoubtedly known to easterners in the Late Bronze Age, it is unlikely that there was any regular interaction except perhaps at the port sites of Scoglio del Tonno, Lipari, and Vivara. Even the connection between the Sherden tribe of the Sea Peoples and the island of Sardinia was not established immediately following the events of Ramesses III's eighth year, but is tied to later Phoenician prospection in and colonization of the western Mediterranean. Any relationship between Sikels and Sicily, or Teresh and Tyrrhenia, would have to be just as late, and must for now remain hypothetical, as only new evidence can associate such specific groups with a new homeland after a hiatus of several centuries.

Notes and Documents

*The Venetian-Seljuk treaty of 1220**

IN the *Liber Albus* is preserved an agreement made in 1220 between the Venetian podestà in Constantinople, Jacopo Tiepolo, and the Seljuk sultan of Konya, Alā al Dīn Kaykubādh I.[1] The text is a Latin version of the podestà's reply to the sultan who had approached the podestà through an embassy. The reply encapsulates the sultan's original application and also contains certain assurances given to him by the podestà. The agreement is a document of some importance. It belongs to a critical phase in the development of Venetian policy in the Levant and is the first substantial evidence for the establishment of political and commercial relations between Venice and the Turks of Anatolia.[2] The form of the treaty is itself remarkable. It involved an exchange of chrysobulls, issued on the one part by the sultan and on the other, not by the doge, but by the Venetian podestà in Constantinople. The text of the agreement shows that both documents were indeed chrysobulls. The phrase in the preamble, 'Recipientes ex parte altitenentis, felicis, magni generis, magni Soldani Turkie, domini Alatini Caicopadi, idest legatum suum gloriosum, familiarem eius . . ., a quo recipientes nos scriptam conuentionem pacis Soldanee sue potestatis, id est chrusobolum eius superscriptum rubeis litteris, et inferius sigillatum

* I am much indebted to Dr A. A. M. Bryer, to Dr Michael Rogers and, especially, to Professor V. L. Ménage for discussion of various aspects of this essay.

1. The text of the agreement is preserved in the *Liber Albus* fos. 52–54 which was compiled on the orders of the doge Andreas Dandolo (1343–1354). There are also versions in the *Liber Pactorum*, I, fos. 243–4 and the *Liber Pactorum*, II, fos. 258–60. It is edited by G. L. F. Tafel and G. M. Thomas, *Urkunden zur älteren Handels- und Staatsgeschichte der Republik Venedig* (Vienna, 1856), ii. 221–5. Their text is virtually that of the *Liber Albus*, except that the phrase 'et despotis' which appears in the protocol between 'imp(er)ij R(omanie)' and 'eiusdem(que) imp(er)ij' is omitted. Tafel and Thomas note only some of the variants occurring in the *Libri Pactorum*, but none of these variants alters the sense significantly. The treaty has been discussed by W. Heyd, *Histoire du commerce du Levant* (French ed., Leipzig, 1923), i. 302–4; by A. Schaube, *Handelsgeschichte der romanischen Völker des Mittelmeergebiets* (Munich and Berlin, 1906), pp. 221–2; by O. Turan in *Islam ansiklopedesi* fasc. 63 (Istanbul, 1955), 658–9; by the same scholar (with Turkish translation) *Türkiye Selçukluları hakkında resmi vesikalar* (Ankara, 1958), pp. 121–46; by T. Talbot Rice, *The Seljuks* (London, 1961), p. 103; and by C. Cahen, 'Le commerce anatolien au début du xiii[e] siècle', *Mélanges Louis Halphen* (Paris, 1951), pp. 96–97 and *Pre-Ottoman Turkey* (London, 1968), pp. 165–6. The studies of Kaykubādh I's reign by H. Jansky, 'Selçuklu sultanlarından Birinci Alaeddin Keykubad'ın emniyet politikası' in *Armagan Zeki Velidi Togan'a* (*Symbolae in honorem Z. V. Togan*) (Istanbul, 1950–5), pp. 117–26; by R. Fahmer, 'Alaeddin Keykubad', in *Robert Boehringer, eine Freundesgabe* (Tubingen, 1957), pp. 193–231, and by C. Cahen in *Encyclopaedia of Islam* (2nd. ed. B. Lewis *et al.* (Leiden and London, 1954–), fascs. 73–74, pp. 817–18, do not deal with the treaty.

2. For the significance of the period, F. Thiriet, *La Romanie vénitienne au moyen age* (Paris, 1959), pp. 88–93, esp. p. 89.

Downloaded from http://ehr.oxfordjournals.org/ at University of Chicago on July 10, 2015

aurea forma sui sigilli, . . .' and the later phrase '. . . secundum tenorem chrusoboli bone memorie patris et fratris sui, et secundum tenorem chrusoboli eiusdem sue Soldanee dominationis; . . .' show the issue of a chrysobull on the part of the sultan and his predecessors. The closing phrase of the concluding protocol, 'Que propria manu et ore super sancta Dei euanglia iurauit meus dispotatus, cum qua in presenti chrusobolosanguineis litteris scripsit mea dominatio, et forma sigilii nostri aurei inposita est, et sanguineo sirico sigillato.', shows that the podestà also confirmed the agreement by issuing a chrysobull.[1] As though conscious of the special form of the documents, the scribe who drew up the Latin version felt it appropriate to dilate on their appearance. Other agreements between Venice and the Muslim powers were in the form either of *precepta* or *pacta*.[2]

The Seljuk sultans of Konya seem to have authenticated their decrees and letters in a variety of ways. Sometimes a form of signature, the *tugra*, was employed,[3] but Ibn Bībī frequently alludes to the sultan's seal ring and on one occasion refers to its use in validating a document.[4] In communications addressed to the Latin powers, however, the later Seljuks seem to have favoured the old imperial Byzantine form of the chrysobull. The use of the chrysobull by the Seljuks is found not only in the agreement under discussion but also on at least one other occasion. When the sultan Ghiyatheddin Kaykhusraw II sent an embassy to Baldwin II, the Latin emperor of Constantinople, in 1242/3, the envoy carried with him letters of credence furnished with a golden bull.[5] Again, a letter of 1214 from

1. The word chrysobull occurs seven times. 'Sirico' = 'cum filo serico', the usual method of affixing the seal by a silk thread in imperial Byzantine documents; *cf.* Tafel–Thomas, ii. 350. The use of red ink in the subscription was of course also a Byzantine practice, and was adopted not only by the podestà but by the Latin emperor: R. L. Wolff, 'The Latin empire of Constantinople', in *A History of the Crusades*, ed. K. M. Setton, ii (Philadelphia, 1962), 190, and the same writer's 'A new document from the period of the Latin empire of Constantinople: the oath of the Venetian podestà', *Annuaire de l'Institut de philologie et d'histoire orientales et slaves*, xii (1952) (= *Mélanges Henri Grégoire*, iv [Brussels, 1953]), 560.

Hugh Lusignan, king of Cyprus, to Izz al Dīn Kay-kāūs I refers to the 'sworn chrysobulls' (*ὁρκωμοτικῶν χρυσοβούλλων*) received by the king from the sultan.[1] In this case however it may be that 'chrysobull' is meant loosely to signify an official despatch, rather than in a literal sense, for elsewhere in the correspondence the sultan's communications are spoken of simply as '*γράμμα*' or '*(ἔγ)γραφα*'.[2]

The employment of the gold seal by a Venetian podestà is, so far as is known, a unique case. While the doge of Venice on occasion used a gold seal, for example in 1210 when the doge, Pietro Ziani, and the despot of Epirus, Michael Comnenus, exchanged chrysobulls confirming a treaty, at other times the doge used only a lead seal.[3] Little is known of the seal of the podestà. The office of podestà of course conferred immense authority on the holder, especially as the first podestà, Marino Zeno, was chosen in Constantinople between the death of the doge Enrico Dandolo on 1 June 1205 and the election of his successor, Pietro Ziani, on 5 August 1205. Intermittently at least the podestà claimed the title of Despot, the title chosen initially by Theodore Lascaris in Nicaea and later employed by the rulers of Epirus.[4] It may have been this title, with its suggestion of regency or deputising for the imperial power itself, that made the podestà consider that the gold seal befitted his dignity. At the end of the treaty, the podestà refers to himself as issuing a *chrysobullum verbum*, that is a *chrysobullos logos*, the instrument by which in the eleventh and twelfth centuries the Byzantine emperors had made concessions to the Venetians.[5] Here the form is

the use of a lead seal by a Danişmend, Sp. Vryonis Jr. 'The Byzantine legacy and Ottoman forms', *Dumbarton Oaks Papers*, 23/24 (1969/70), 275 and the same writer's, *The Decline of Medieval Hellenism in Asia Minor and the Process of Islamization from the Eleventh through the Fifteenth Century* (California, 1971), p. 470.

2. Lampros, pp. 46, 48 and 51.

3. The agreement with Epirus, Tafel–Thomas, ii. 119–20; in a document of 1259 the use of a gold seal in the doge's name is especially noted, *ibid.* iii. 31. For the use of a lead seal by the doge, *ibid.* ii. 175, 180.

4. On the podestàs, *cf.* the two works of Wolff cited in p. 322 n. 1 above; also Thiriet, *Romanie vénitienne*, pp. 79–81, 88–93 and S. Borsari, *Studi sulle colonie veneziane in Romania nel xiii secolo* (Naples, 1966), pp. 88–91. Jacopo Tiepolo is the first podestà known to have used the title of Despot, Wolff, 'A new document', p. 560: *cf.* also V. Lazzarini, 'I titoli dei dogi di Venezia', *Nuovo archivio veneto, nuova serie*, v (1903), 271–311, esp. 297. A seal of a podestà surnamed Quirini (several members of the family held the office) is published by G. Schlumberger, F. Chalandon and A. Blanchet, *Sigillographie de l'orient latin* (Paris, 1943), p. 209. The material is not specified, but the context makes it clear that it is of wax, and not of lead as stated by T. Bertelé, 'Moneta veneziana e moneta bizantina', in A. Pertusi (ed.) *Venezia e il levante fino al secolo xv* (Florence, 1973), p. 16 n. A seal of the podestà is mentioned but unfortunately not described in Tafel–Thomas, i. 574.

5. *E.g.* Tafel–Thomas, i. 115–24. The chrysobull was the instrument by which, some months before the agreement under discussion, Theodore Lascaris, emperor of Nicaea, made concessions to the Venetian podestà; Tafel–Thomas, ii. 205–7. When in 1234

Downloaded from http://ehr.oxfordjournals.org/ at University of Chicago on July 10, 2015

usurped, not by the Latin emperor, but by a Venetian official. The podestà evidently chose the most portentous diplomatic form available to him in order to impress upon the Seljuk sultan the power of the Venetians. No doubt the Seljuks were already aware that the Venetians were a force to be reckoned with; certainly the sultan of Egypt seems at times to have regarded the doge, rather than the Latin emperor, as the effective ruler of Constantinople.[1]

The document opens with a dating formula, 'Anno domini Dei et Saluatoris nostri Jhesu Cristi.', but the year is not in fact stated. The date given in the body of the text is 'the month of March in the eighth indiction', that is, March 1220, for the eighth indiction ran from September 1219 to September 1220. This is the date given by Tafel-Thomas and generally accepted.[2] However this date, March 1220, is irreconcilable with the accession date of Kaykubādh I as given in a number of standard works which place his accession only at the end of 1220. This date for Kaykubādh's accession seems to be derived from H. W. Duda's German translation of the chronicle of Ibn Bībī which has 4 Shawwāl 617 = 2 December 1220 as the death-date of Kaykubādh's predecessor, Izz al-Dīn Kay-kāūs I. Duda cites an inscription on Kay-kāūs's mausoleum in confirmation of this date.[3] However, V. L. Ménage points out the existence of two silver coins of Kaykubādh I securely dated 616, that is, 19 March 1219–7 March 1220; these prove that Kaykubādh was already sultan at least by the first week of March 1220. Ménage also observes that the date given in Duda's translation of Ibn Bībī occurs only in the abridgement of 1284/5 and not in the original of 1281, and that the inscription commemorates the completion of the mausoleum, not the death of Kay-kāūs.[4] Jacopo Tiepolo is known to have been podestà in Constantinople on 10 December 1219 and in June 1220, so the date of March 1220 falls within the period of his tenure of

certain Cretans sought assurances from the doge, they asked him to send them a chrysobull (grissovolum). They evidently expected the doge to continue the administrative practices of their former Byzantine masters, Tafel–Thomas, ii. 325. On the form of the *chrysobullos logos*, F. Dölger and J. Karayannopulos, *Byzantinische Urkundenlehre* (Munich, 1968), pp. 117–25.

1. Tafel–Thomas, ii. 190.

2. *Ibid.* ii. 221. Dandolo, who briefly mentions the treaty, assigns it to the fourteenth year of the dogeship of Pietro Ziani, that is to the period Aug. 1218 to Aug. 1219: this is perhaps because he records it in the same sentence as the treaty with Lascaris which belongs to Aug. 1219, A. Dandolo, *Chronica per extensum*, ed. E. Pastorello in L. Muratori, *RISS*, xii (Bologna, 1938), 281. Thiriet, *Romanie vénitienne*, p. 89 n. 1, gives the date as *October* 1219.

3. Duda, *Ibn Bibi*, p. 90. Cahen, *Pre-Ottoman Turkey*, p. 124, has 'end of 1220' for Kay-kāūs's death. In the *Encyclopaedia of Islam* (English text), fasc. 73–74, Kay-kāūs is said to have died in '618/end of 1220' and Kaykubādh's accession is given as 618/1220, pp. 813, 817. However 618 is in fact 25 Feb. 1221 – 14 Feb. 1222. In the French text, *Encyclopédie de l'Islam*, fasc. 73–74, p. 846, Kay-kāūs's death is placed 'fin 1221'.

4. These points are made in a recent letter from Professor Ménage to me. The coins are published in Ismail Ghalib, *Takvim-i meskūkāt-i selcūkiyye* (Istanbul, 1309/1891–2), p. 26.

Downloaded from http://ehr.oxfordjournals.org/ at University of Chicago on July 10, 2015

office.[1] The date as given in the text of the *Liber Albus* is therefore compatible with both the Seljuk and the Venetian sources.

The treaty renews the stipulations of two earlier thirteenth-century agreements between the Venetian podestà in Constantinople and the sultans of Konya, but even before these agreements it is reasonable to suppose some trade between Venice and the Turks. In the chrysobull of 1082/4 Alexius Comnenus conceded freedom of trade to the Venetians throughout the empire and singled out some thirty-two localities for particular mention, presumably because these were places where his officials were most likely to encounter Venetians.[2] Among these localities were Chios, Abydos and Strobilos, and since Turks are known briefly to have occupied Chios and Abydos in the 1090s and to have ravaged Strobilos in 1103,[3] it is probable that some contact between Venetians and Turks occurred: certainly in the twelfth century the opportunities for such contact must have been many. The two earlier agreements, also in the form of chrysobulls, are attributed to the father and brother of Kaykubādh I. The father is Kaykhusraw I who was sultan for the second time between *c.* 1205 and 1211: the brother was his successor, Kay-kāūs I. It appears therefore that Kaykubādh, soon after his accession, confirmed the previous agreements just as formerly, on the death of a Byzantine emperor, the Venetians applied to his successor for confirmation of their privileges. Such an application for renewal was normal procedure and was a safeguard against the sudden seizure of property on the death of a ruler.[4] In this instance however it seems to have been the sultan who sent envoys to the podestà rather than the Venetians who appeared as suppliants before the sultan. Furthermore, these agreements with the Seljuks, unlike the agreements of the late eleventh and twelfth centuries between Venice and the Byzantine emperors which extended for an unlimited period, were for two years only. It may then have been simply a question of application for renewal on the expiry of the previous treaty. These short-term agreements are not remarkable; both Venetian and Turkish agreements of limited duration are known from the twelfth and thirteenth centuries.[5]

1. Tafel–Thomas, ii. 215–21: Wolff, 'A new document', 560.

2. Tafel–Thomas, i. 51–54.

3. Cahen, *Pre-Ottoman Turkey*, p. 81; P. Wittek, *Das Fürstentum Mentesche* (Istanbul, 1934), p. 3.

4. For an example of an application for renewal, see the events following the accession of John II Comnenus in 1118 as described in *Historia ducum veneticorum*, ed. H. Simonsfeld, *MGH, SS*, xiv (1846), 73 and by Dandolo, p. 232. The fear of seizure is apparent in the agreement between Venice and the ruler of Aleppo in 1225, Tafel–Thomas, ii. 257.

5. Dandolo gives many examples, pp. 229–303. In 1283 a Venetian envoy to the Byzantine court was given the power to make an agreement to run between seven and ten years, as he thought best, R. Cessi, *Deliberazioni del Maggior Consiglio di Venezia* (Bologna, 1932–1950), iii. 49–54. The Seljuk – Cypriot treaty was for three years only, Lampros, p. 48.

Downloaded from http://ehr.oxfordjournals.org/ at University of Chicago on July 10, 2015

Cahen suggests that although the agreement with Kaykubādh was for two years only, it was probably more or less tacitly renewed.[1] It is in fact known that in 1228 a Venetian envoy named Filippo Iuliano was in Konya where he encountered another Venetian, Marco Longo, a member of an embassy sent by Narjot de Toucy, *bailli* of the Latin emperor. Iuliano noted with some indignation that Longo presented the sultan with gifts of armour and weapons.[2] Unfortunately the object of Iuliano's embassy is unrecorded; but he was the envoy of the doge, not of the podestà. Perhaps it is to be concluded that until the early 1220s, the podestà managed relations with the Seljuks but thereafter the doge took negotiations into his own hands.[3] It may be possible to assign a more precise date to the concession associated with Kaykhusraw I, for in March 1207 the sultan took Antalya from Aldobrandini, a Tuscan adventurer formerly in Byzantine employ, and in 1209 Venice acted as intermediary between the Latin emperor and the sultan in arranging a truce.[4] It is tempting to speculate that the Venetians took this opportunity to negotiate an understanding with the sultan which would guarantee their access to, and commercial interests in, the newly conquered port. Routes from Antalya extended across the plateau of Asia Minor and it was a convenient port of call for Venetian merchants trading with Rhodes, Cyprus, Lajazzo and the Syrian ports.[5] The value of the concessions was further increased by the Seljuk occupation of Kalonoros in 1221 and subsequently of other coastal towns in the region.[6] In the north the acquisition of Sinope in 1214 gave the Seljuks a permanent outlet to the Black Sea where Venetian traders were already active.[7]

The commercial and judicial clauses of the treaty and their implications must now be considered in detail. The treaty provided

1. Cahen, *Pre-Ottoman Turkey*, p. 166.

2. Cessi, *Deliberazioni*, i. 208. Iuliano is not known to have had any earlier association with the Levant. In 1227 an F. Iuliano was witness to an incident in Venice and he had also been podestà in Chioggia, *ibid.* i. 185, 190.

3. The doge supervised negotiations with Aleppo in 1207–8 and in 1225, Tafel–Thomas, ii. 64, 256.

4. Duda, *Ibn Bibi*, pp. 44–46; Cahen, *Pre-Ottoman Turkey*, p. 120. Antalya was re-occupied for a time by the Franks between 1210 and 1216, Duda, pp. 61–64; S. Lloyd and D. S. Rice, *Alanya ('Ala'iyya)* (occasional publication of the British School of Archaeology in Ankara, 1958), p. 52. For the Venetians as intermediaries, E. that payment of duty by Venetian merchants should be at a standard rate of 2 per cent except for certain totally exempted categories of merchandise. Reciprocal guarantees for the safety of the subjects of both parties to the treaty and their property in the event of shipwreck or other misfortune were agreed. The Venetians were to enjoy certain judicial privileges in the territories of the sultan.

The provision for the payment of duty at a standard rate of 2 per cent was a concession of great value. Although the Venetians traded duty-free in the Latin empire and in some other Christian states such as Epirus, Nicaea and, later, Little Armenia,[1] the rate of 2 per cent *ad valorem* was exceptionally low. Cahen considers the normal rate would have been at least 10 per cent.[2] In the Venetian treaty of 1207/8 with Aleppo, the general rate was 12, reduced in 1225 to 6 per cent.[3] Payment at so low a rate as 2 per cent is only occasionally encountered elsewhere, as for instance, in 1217 when Guy, Lord of Byblos, reduced the duty payable by Venetians from 4 per cent and four *quarroblas* to 2 per cent and two *quarroblas*.[4] Scarcely less valuable was the simplicity of the system in contrast to the elaborately graded system of tariffs in other Muslim states. The Seljuk concession must greatly have facilitated commercial transactions. Earlier and contemporary sources for the history of commerce in the Levant often give the impression that harassment by officials and disputes about liability as much as the duties themselves vexed merchants and imperilled relations between merchants and rulers.[5]

1. Tafel–Thomas, ii. 121–2, 206 and 426–7. In Armenia duty on certain classes of metals was still payable by Venetians resident abroad.

2. Cahen, 'Commerce anatolien', 96; *Pre-Ottoman Turkey*, p. 165.

3. Tafel–Thomas, ii. 65, 257. There was a general trend towards lower duties: *cf.* J. Riley-Smith, 'Government in Latin Syria and the commercial privileges of foreign merchants' in D. Baker (ed.) *Relations between east and west in the middle ages* (Edinburgh, 1973), pp. 110, 113 and 117.

4. Tafel–Thomas, ii. 196–7. '*Quarrobla*' = *keration* (the word originally denoted the weight of a carob seed): a *keration* was 1/24 of a *solidus*. Fractional percentages were commonly expressed in *keratia*, Tafel–Thomas, ii. 398; Riley-Smith, p. 130 n. 113. Early in the next century the Pisans paid only 2 per cent on trade in Pera, B. Pegolotti, *La pratica della mercatura*, ed. A. Evans (Cambridge, Mass., 1936), p. 41.

5. Examples of more complex systems of tariffs are to be found in the terms of the agreements between Venice and Antioch in 1153 (Tafel–Thomas, i. 133–5), between Venice and the Muslim Lord of Saone in 1229 (*ibid.* ii. 272–3) and between Venice and Aleppo in 1207/8 and 1229 (*ibid.* ii. 62–66 and 274–6). The way in which the bull of Alexius I to the Venetians (*ibid.* i. 51–54) grants total immunity from taxation and then proceeds to list all the taxes which the Venetians do *not* have to pay suggests that disputes about liability to the various taxes easily arose. The precision in the classification of goods exempt from certain duties in a privilege of John Ibelin, Lord of Beirut, in 1222 anticipates and is concerned to prevent disputes over the status of different categories of merchandise (*ibid.* ii. 232–4). An agreement with Egypt in the early thirteenth century also indicates concern about unjust exactions (*ibid.* ii. 185–7). On the problems arising from the complexity of tolls and the attempts at evasion, see G. Rouillard, 'Les taxes maritimes et commerciales d'après les actes de Patmos et de Lavra', *Mélanges Charles Diehl*, i (Paris, 1930), 277–89, esp. 288–9; C. Cahen, *La Syrie du nord à l'époque des croisades* (Paris, 1940), pp. 477–8 and 'Douanes et commerce dans les

Downloaded from http://ehr.oxfordjournals.org/ at University of Chicago on July 10, 2015

The treaty gave the Venetians total exemption from payment on corn, pearls, precious stones and both worked and unworked gold and silver. Although the recovery of agriculture in Asia Minor in the early thirteenth century is well attested both in the Greek empire of Nicaea and in the Seljuk lands,[1] there seems to be no other reference to the export of corn by the Seljuks until late in the century, when Canale mentions the Turks, together with many other peoples, as suppliers of corn to Venice in the famine of 1268.[2] Pegolotti, writing in the first half of the next century, implies that corn was exported to the west from Asia Minor.[3] It was perhaps to stimulate trade in a surplus of corn that the sultans allowed the Venetians to carry it duty free. The import of corn into the growing city of Venice was an important consideration in the minds of the Venetian authorities.[4]

The exemption of the other categories – pearls, precious stones, gold and silver – is perhaps to be explained by the fact that these served on occasion as a substitute for coinage. The Polos, for instance, carried jewels both as a medium of exchange and as a repository of value.[5] Pearls and precious stones and metals were commonly exempted from payment of duty or given special rates in treaties with the Muslim powers.[6] These total exemptions together with the low, standardized rate, must have given the Venetians an edge over their competitors in the Seljuk lands.[7]

Other clauses accorded protection to Venetian vessels shipwrecked in Turkish waters or seeking refuge in Turkish ports. Venetian subjects aboard non-Venetian ships were promised similar protection. Even non-Venetian pilgrims falling into Turkish hands were to be set free. Reciprocal clauses gave similar assurances in the event of Turks falling into Venetian hands, and the Venetians undertook to respect Turkish property in the event of death and to make amends for any losses the Turks might sustain through theft while in places under Venetian jurisdiction. While similar provisions

are to be found in some other commercial treaties of the period, the pledges given in the treaty of 1220 were more extensive than was usual: the degree of security afforded to Venetian merchants must have encouraged them to venture into Seljuk markets.[1] The protection promised to Turks on board vessels falling into Venetian hands perhaps reflects, like the building of the celebrated arsenal at Alanya (the former Kalonoros), a growing Turkish involvement in maritime affairs.[2]

By the agreement, the sultan conceded certain judicial privileges to the Venetians in his domains: in any dispute arising between Venetians and other Latins – the Pisans are mentioned by name – judgment was to be given by appropriate Venetian officials, unless the case was one of assault with a weapon, or theft. In these cases judgment was reserved to the sultan's court. This clause ensured that commercial cases involving only Latins would be settled by the Venetians. Nowhere else did the Venetians obtain a comparable advantage; although frequently enjoying special legal privileges, these privileges extended in other instances only to the settlement of disputes between the Venetians themselves, between those living in Venetian quarters, or between the Venetians and the subjects of the ruler who made the concession.[3] The legal standing *vis-à-vis* their rivals secured by the Venetians in this agreement was superior to any they enjoyed in the Levant outside their own colonies. However, the treaty gave the Venetians no right to property, no possession of *fondaco*, mill, church or bath such as they held in many eastern cities, both Christian and Muslim[4]; nor was there any assurance, such as the Venetians enjoyed at Aleppo, that the Venetian merchant

1. The right to plunder a shipwrecked vessel was of course taken for granted, *cf.* Usāmah ibn-Mundiqh, *Kitāb al-I'tibār*, trans. P. K. Hitti, *Memoirs of an Arab-Syrian gentleman* (edition of Beirut, 1964), p. 61. For examples of treaties affording protection in the event of wreck, Tafel–Thomas, i. 87, 134; ii. 122, 206, 232, 273, 276 and 484. The Seljuk–Cypriot agreement of 1216 promised protection in case of wreck but implies that such protection was unusual, Lampros, p. 49. In other treaties rulers reserved their full or partial rights to wreck, for example, Leo III of Armenia in 1271 (Tafel–Thomas, iii. 116). The ruler of Aleppo retained 15 per cent of salvage in a treaty of 1225, Tafel–Thomas, ii. 257.

2. Lloyd and Rice, pp. 16–18; Cessi, iii. 125.

3. The *pactum Warmundi* of 1123 assigns commercial cases between Venetians and cases where the defendant is a Venetian to a Venetian court, but carefully reserves cases where a Venetian is plaintiff to the royal court, Tafel–Thomas, i. 87. In a privilege of 1201 Leo II of Armenia reserves all cases between Venetians and others to the royal court, *ibid.* i. 384. See also the privileges granted to the Venetians in Constantinople by Alexius III Angelus in 1198, Tafel–Thomas, i. 273–6, and the comments of C. M. Brand, *Byzantium confronts the west* (Cambridge, Mass., 1968), pp. 202–3. The Venetians in Saone had the right to settle internal disputes, Tafel–Thomas, ii. 273. In Antioch all cases in which a Venetian appeared as defendant were resolved in their own court, *ibid.* i. 134. In his report, the Venetian *bailli* in Syria in 1243 stoutly upheld the right to judge non-Venetians in the Venetian quarter of Tyre, *ibid.* ii. 358. In Beirut however John of Ibelin retained jurisdiction in all criminal cases, *ibid.* ii. 231.

4. For example, in a Christian city, Acre, *ibid.* i. 85; in a Muslim city, Aleppo, *ibid.* ii. 65, 276.

Downloaded from http://ehr.oxfordjournals.org/ at University of Chicago on July 10, 2015

community would not be punished for the misdeeds of one of its members.[1]

The provisions of the commercial agreements made by the Mediterranean powers often appear arbitrary, complex and difficult to interpret in their details. They perhaps represent compromises reached after hard bargaining. This treaty gave the Venetians very favourable tariffs, security and a strong legal position: in short, the concessions most likely to benefit merchants seeking to penetrate relatively new markets. The absence of rights to property and of explicit provision for the settlement of disputes among the Venetians themselves and of protection for the community against reprisals for the action of its members, support this view that in the Seljuk lands the Venetians were only few in number and ill-established. They had as yet no need of the communal and property rights so assiduously sought and obtained elsewhere. If the treaty shows the Venetians as poised to exploit the potential of the Seljuk markets, the agreement was no doubt equally acceptable on the Turkish side. All the eastern rulers profited greatly from the commerce that passed through their territories and the Seljuk rulers were, more than most, concerned to foster and promote mercantile activity in their domains.[2]

DOI: 10.48255/2612-3703.9788891323118.05

The letter by Cassiodorus published here[1], deserves a note of comment, not because it is representative of the author's intellectual profile and a remarkable example of high literary quality, which it is (*fig. 1*), but because of the extraordinary amount of information we can derive from the short text[2].

The letter is addressed to the *Tribuni Maritimi* and dated after 1 September 537. First of all, a definition of the term "tribunus" in the institutional lexicon of the time is called for. The term, since the first decades of the 4th century AD, defines the role of an apical figure of the cohorts of "civic police" appointed to control the regular development of urban commercial and social activities. Specifically, the figure of the *Tribunus Fori Suarii*, attested by the times of Maxentius and Constantine, was in charge of supervising the expensive swine market (*caro suina*). In the Constantinian period other "tribunus" figures were also attested and their roles, as evidenced by the title, would have referred to the protection of order and public safety[3]. In our case, the *Tribuni Maritimi* to which Cassiodorus addresses his note, are obviously an administrative body and, unlike the other "tribunati" known at the time, they are a collegial body. The powerful *Praefectus*

praetorio Italiae questions the Tribunes with competence on the coasts of the "Venetiae" to promptly prepare to ensure safe transfer of food from Histria to the Ravenna headquarters, as required by the previously issued order (§1: *data pridem iussione*).

According to the letter, the *Tribuni maritimi* reside in the "Venetiae" area, and Cassiodorus addresses them with a tone of complicity, highlighting his direct knowledge of the territory (§3: *perspeximus*). And it is precisely the direct experience of the Author in relation to geography, social customs, and the local economy that makes his testimony so precious.

From our perspective, the precise definition provided of the territory is crucial: the "Venetiae" to which Cassiodorus refers, do not define, as in almost all the other ancient sources, the wide region that includes the Po valley and reaches as far north as Histria, as far south to include at least Adria, and *also* includes the coastal territories that overlook the large northern gulf of the Adriatic. Instead, these "Venetiae" administered by the *Tribuni Maritimi*, at least for that which concerned the commercial and transport aspects, are specifically the Venice lagoon, understood in a broader sense as the system of the upper Adriatic lagoons.

At the heart of the representation is a hybrid landscape: a fluid matrix of land and water, in which the shallow waters of a sea-non-sea, respond to the gravitational pull of the moon, generating a tidal force that alternatively reveals and conceals the fragmented profiles of the emerged lands (§3: *alternus aestus egrediens modo claudit, modo aperit faciem reciprocal inundatione camporum*), that shelter boats and structures from storms and waves. The hydrogeological characteristics of the lagoon neutralize the devastating and ruinous effects of storm surges. The houses scattered throughout the small insulae do not have solid foundations but are anchored to precarious wicker supports, made of rattan poles. Nonetheless those apparently fragile materials (§4: *tam fragilis munitio*) are sufficiently adequate, and most suitable for the specific function because, unlike solid earth, they have the qualities of flexibility and elasticity which are necessary in the lagoon. The materials need to be structurally complicit with the discontinuous motion of the waters. The ensemble of the constructed houses depict a profile of an anthropized archipelago, that mirrors a miniature image of the Cyclades islands, scattered over the sea (§3, §4).

In the Venice Lagoon, as in the Greek sea, Nature can only be responsible for the delightful frame, but what is pictured on the canvas mostly depends on the care of Man (§4: *quae natura protulit, sed hominum cura fundavit*). The urban landscape of the Lagoon is a constellation in which the lines of conjunction do not pass through natural elements but are traced between the buildings. Nevertheless, the architecture, designed according to the specific local style, recalls an universal style that characterises insular architecture, at any latitude. Among these houses, resting on land accustomed to appearing and disappearing with the tides, boats can be seen passing by, and to the eye of a distant spectator, they seem to float over the meadows, due to the flat and horizontal perspective that conceals the channel on which they travel (§2: *putantur eminus almost for prata ferri, cum eorum contingit alveum non videri*). The vivid image Cassiodorus conjures from a different time and dimension, is exactly the same as that which any citizen of contemporary Venice would behold, as they see passenger ships passing between the roofs of the city, with amused amazement – or with horror, in the case of monstrous cruise boats similar to floating skyscrapers that reach and exceed the height of the bell towers.

Cassiodorus does not reproduce the topoi taken from all the ancient sources, regarding the fertility of the places and the benignity of the climate of the Venetian lagoons. If the surrounding territory, Histria for example, produces particularly abundant harvests of wine, oil and wheat, in the Lagoon there is only fish to eat, and the only investment is in the salt pans from which the local dish is made. The coin minted in Venice is extraordinary, because it only serves to live "here" where man has little other to invent. In other words, in the Venetian Lagoon, Man has made the wise choice of supporting what nature offers him, a unique and pleasant

form of life and having in return the collaboration of nature itself in his "art", in a setting in which the waves themselves collaborate in the production of resources (§6: *Arti vestrae omnis fluctus addictus est*). A concrete example: in "Venetiae" salt is worth more than gold, not only for its market value, but because salt makes any food tasty. Salt is considered not only as an elementary currency and form of economic investment, but as a factor of pleasure. In this context, techniques and experiences were also developed, such as the nautical expertise of the inhabitants of "Venetiae" to which the Prefect reserves considerable recognition: specifically, the *Tribuni Maritimi* are entrusted with the task of organizing transport by sea of foodstuffs towards Ravenna, and the Tribunes will certainly be able to complete the mission, given that they move in the sea as if they were at home and that they are accustomed to many other, and longer, crossings (§1: ... *ad vicina, qui saepe spatia transmittitis infinita*).

And it is precisely starting from these physical and material, geographical and economic, assumptions, that Cassiodorus also exercises his political contemplation, and with a notable conceptual leap, highlights the particularity of the extraordinary forms of social and political life in "Venetiae": the unique food resource (the fish), the very aspect of the houses, and the construction techniques naturally caused the elimination of social and economic differences. Everyone eats the same fish, everyone lives in similar houses: therefore, poverty coexists with wealth, indeed poor and rich people are indistinguishable and there is no reason for envy among individuals, or social classes. There is nothing to be envied in a society where everyone lives in the same type of house and eats the same fish. In fact, a sort of 'democracy by nature' has been established in "Venetiae", induced by the same geophysical conditions of the territory, which we can consider the harbinger of the institutional structure of the Serenissima Repubblica.

Cassiodorus gives the name of "Venetiae" to this landscape and its social, economic and political system, and this "Venetiae", in a text dated within the first half of the VI Century, is presented as already famous and prestigious, with a history and a past in which it was inhabited by noble people (§3: *Venetiae praedicabiles*, *quondam plenae nobilibus*). Cassiodoro's letter is the first testimony of a consolidated urban structure, the unprecedented description of a reality undoubtedly presented as already mature and advanced under all profiles – architectural, social, economic, technical, administrative, and institutional.

Nevertheless, the letter is also an official document, an exhortation to the *Tribuni* to be ready to do their job. The ring composition of the text is construed with great skill: if in the first paragraph we find the image of the ships controlled by the *Tribuni* accustomed to navigating the sea as if they were "at home", in the last paragraph we find the urgent invitation to put those boats to use, rather than keep them tied to the walls of the buildings "as if they were animals", to

make haste and prepare them for the journey, without wasting time. In Ravenna, they are waiting and the *Tribuni* will certainly be able to find the shortest way, among the endless untracked paths of the sea, taking into account the climatic factor in the days in which the transport will take place. "Make haste" (§1, §7: *Estote… promptissimi […] Festinetis excurrere*): the institutional, strong and authoritative voice of the *Prefectus Pretorio Italiae* sounds peremptory. It is a role that Cassiodorus will keep for just a while longer. Shortly thereafter, the phase of his progressive marginalization from institutional posts begins, leading to the definitive retirement in his homeland, Calabria. Here, the "the first humanist[4]" will endeavor to accomplish his visionary utopia, an anticipation of the activity of recovery and conservation of classic texts that the intellectuals of the Renaissance will undertake nine centuries later: the grandiose cultural enterprise of the *Vivarium*, where the aim will be to collect and "raise" not fish but books.

THE LETTERS OF CASSIODORUS. A CONDENSED TRANSLATION OF THE VARIAE EPISTOLAE OF MAGNUS AURELIUS CASSIODORUS SENATOR

XII, 24 TRIBUNIS MARITIMORUM SENATOR PPO.	
[1] *Data pridem iussione censuimus ut Histria vini, olei vel tritici species, quarum praesenti anno copia indulta perfruitur, ad Ravennatem feliciter dirigeret mansionem. Sed vos, qui numerosa navigia in eius confinio possidetis, pari devotionis gratia providete ut quod illa parata est tradere, vos studeatis sub celeritate portare. Similis erit quippe utrisque gratia perfectionis, quando unum ex his dissociatum impleri non permittit effectum. Estote ergo promptissimi. ad vicina, qui saepe spatia transmittitis infinita.*	[1] We have already established with a previous order that Histria will beneficially send to Ravenna headquarters wine, oil and wheat which this year is in great abundance. Now, you, who have numerous ships on the borders of the region, get busy with the same zealous liberality, as soon as possible, to transport the goods that are ready for shipment. In fact, the benefit of completing the mission will be an advantage for both of us, since none will be able to accomplish it. So, you who usually cross immense distances, be very ready to reach nearby shores,
[2] *Per hospitia quodammodo vestra discurritis, qui per patriam navigatis. Accedit etiam commodis vestris quod vobis aliud iter aperitur perpetua securitate tranquillum. Nam cum ventis saevientibus mare fuerit clausum, via vobis panditur per amoenissima fluviorum. Carinae vestrae flatus asperos non pavescunt: terram cum summa felicitate contingunt et perire nesciunt, quae frequenter inpingunt. Putantur eminus quasi per prata ferri, cum eorum contingit alveum non videri. Tractae funibus ambulant, quae stare rudentibus consuerunt et condicione mutata pedibus iuvant homines naves suas: vectrices sine labore trahunt et pro pavore velorum utuntur passu prosperiore nautarum.*	[2] In a sense, you travel through your own abodes, as the navigation is within your homeland. This also is to add to your advantages: another route is open for you, that is peaceful and always safe. Indeed, when the sea route could be closed by raging winds, a way is opened to you through the wonderful rivers landscape. The hull of your boats does not fear the harsh winds: it lands safely and, even if they frequently run aground, they should not be destroyed. Beholders from afar, believe that ships are carried across the meadows, when, as happens, the channels they are travelling is not visible. The ships move pulled with cords, which thanks to the ropes are held steady. In essence, with reversed parts, it is the men who help their boats with their feet: they drag the transport boats effortlessly and, on avoiding sails, the captains exploit the more useful step of their sailors.

[3] *Iuvat referre quemadmodum habitationes vestras sitas esse perspeximus. Venetiae praedicabiles quondam plenae nobilibus ab austro Ravennam Padumque contingunt, ab oriente iucunditate Ionii litoris perfruuntur, ubi alternus aestus egrediens modo claudit, modo aperit faciem reciproca inundatione camporum. Hic vobis aquatilium avium more domus est: nam qui nunc terrestris, modo cernitur insularis, ut illic magis aestimes esse Cycladas ubi subito locorum facies respicis immutatas.*	[3] It is worth remembering the situation of your dwellings, as I myself have seen them. The prestigious Venetiae, once full of nobles, reach Ravenna and the Po on the South, while on the East they enjoy the delightsomeness of the Ionian shore, where the alternating tide now discovers now hides the face of the fields, depending on the ebb or flow of waters. There, your dwellings are similar to the waterfowl ones. Here, he who just now was terrestrial, suddenly appears as an islander: and you might believe that they are the Cyclades, where at every moment you see the appearance of the places changing.
[4] *Earum quippe similitudine per aequora longe patentia domicilia videntur sparsa, quae natura protulit, sed hominum cura fundavit. Viminibus enim flexibilibus illigatis terrena illic soliditas aggregatur et marino fluctui tam fragilis munitio non dubitatur opponi, scilicet quando vadosum litus moles eicere nescit undarum et sine viribus fertur quod altitudinis auxilio non iuvatur.*	[4] Just like in the Greek islands, your dwellings appear scattered amid the wide expanse of the open sea, produced by Nature, but built by the care of man. In fact, there the solidity of the ground is strengthened with flexible wicker bound together, and so fragile a defense undoubtedly manages to counteract the waves of the sea, since the shallow seabed is unable to produce a mass of waves, and the waters rise without force, unsupported by the sea depth.
[5] *Habitatoribus igitur una copia est, ut solis piscibus expleantur. Paupertas ibi cum divitibus sub aequalitate convivit. Unus cibus omnes reficit, habitatio similis universa concludit, nesciunt de penatibus invidere et sub hac mensura degentes evadunt vitium, cui mundum esse constat obnoxium.*	[5] Therefore, the inhabitants have only one resource, gorging themselves on fish only. There, poverty coexists with the rich, in a regime of equality. A unique kind of food feeds all, a single type of dwelling is the same for all. They do not have matter to envy each other's homes, and, thanks to this sober lifestyle, they escape the vice to which the rest of the world is subjected.
[6] *In salinis autem exercendis tota contentio est: pro aratris, pro falcibus cylindros volvitis; inde vobis fructus omnis enascitur, quando in ipsis et quae non facitis possidetis. Moneta illic quodammodo percutitur victualis. Arti vestrae omnis fluctus addictus est. Potest aurum aliquis minus quaerere, nemo est qui salem non desideret invenire, merito, quando isti debet omnis cibus quod potest esse gratissimus.*	[6] On the other hand, every effort is aimed at exploiting the salt pans; instead of plows and scythes, you roll your cylinders. This is where your whole crop comes from, since you enjoy a resource that you have not produced by yourselves. Thence the money you need to live is coined, so to speak. Each wave is at the service of this art of yours. Maybe there is someone who is not interested in looking for gold, but there is no one who does not want to find salt, because it is thanks to it that any food can become very pleasant.

[7] *Proinde naves, quas more animalium vestris parietibus illigatis, diligenti cura reficite, ut, cum vos vir experientissimus Laurentius, qui ad procurandas species directus est, commonere temptaverit, festinetis excurrere, quatenus expensas necessarias nulla difficultate tardetis, qui pro qualitate aeris compendium vobis eligere potestis itineris.*	[7] Therefore, repair very carefully the ships that you keep tied to the walls of your houses, as if they were animals, so that when the experienced man *Laurentius* who was sent by you to get goods, will urge you, you will hurry to get to work, so as not to interfere with any delay in the necessary expenses, and so that, depending on the climate, you can choose the shortest route.

Abstract

The article offers an in depth focus on the famous letter XII, 24 of Cassiodorus, written in 537 AD to the "Tribuni maritimi" of the Venetiae. Starting from a new translation of the text and a grounded lexical analysis, the article emphasizes some important aspects related to the perspicuous characters of the Venice Lagoon: the legal role of the "Tribuni" in the control and management of the lagoons; the description of the landscape; the aspect of the buildings peculiar of the lagoon context, and the life in the islands; the solid government of the area based on the Roman administrative structure and jurisdiction. Thanks to this new interpretation, Cassiodorus' testimony appears of great importance for reflecting on the Venetian lagoon in a crucial phase at the end of Antiquity and the beginning of Venetian rule over the territory.

Will this Psalm make an easy introduction into Latin for a first year Latin student? Will it be easy for a second year Latin student? Or for a third year Latin student? Will the queer capitalization and punctuation add to the ease of interpretation? Will even the advanced scholar find it easy to interpret some of the expressions? Will any one find it easy to fit the familiar English version to the Latin?

(To be concluded)

CHARLES KNAPP

THE GREEK EXPLOITATION OF EGYPT[1]

A modern student who attempts to understand the economic life of the ancient Greeks and Romans is handicapped in two particular ways. Immediately he is confronted by the fact that up to the present it has been impossible to write an adequate consecutive history of ancient economics. Many intensive and difficult detailed investigations of special subjects and places must be made, especially in the field of archaeology, before such an economic history can be attempted with any hope of success. Lacking the comprehensive knowledge which could be obtained from such a trustworthy survey, the modern scholar carries with him into the study of antiquity the economic preconceptions of his own day, of which he can divest himself only with the greatest effort. Unless he is constantly on his guard his figures will fit themselves into this background. Then the result will be that his ancient people and ancient life will be exaggeratedly modern, and untrue to themselves. If, on the other hand, the present-day scholar is too conscious of his own economic modernity, his actors and their actions tend to appear as detached from any economic background, or as bizarre figures which react much too primitively to the stimuli of historic life, their doings unmotivated by the fundamental economic necessities which assuredly influenced them.

The second difficulty arises out of the 'classical' training in the Greek and the Latin languages and literatures which is the essential equipment of any man who ventures into the field of ancient economic research to-day. In its better forms this training is excellent as an induction into the methods of a critical approach to historical sources. It tends, however, to be highly subjective and even idealistic, so much so that one is justified in speaking of a 'classicistic attitude' toward ancient culture. The ancient historian must, therefore, marshal to his aid a degree of sane realism, which is equally necessary and more easily maintained in other fields of historical investigation. Alma-Tadema's painting, A Reading from Homer, which hangs in reproductions upon the walls of so many of our Secondary Schools, is aesthetically and in point of composition a rather notable work of art. It is also a drastic example of the worst form of classicism. As a symbol of the culture of the ancient Greeks, it is sentimentally idealistic, inept, misleading, and even dangerous. The ancient Hellenes had little enough time to lie prone beside the wine-colored sea, with chins propped on their hands, listening raptly to readings from Homer. One knows their life and their appreciation of Homer much better by a simple reading of the Ion of Plato, and by allowing, even there, for a certain amount of idealization. Crassly stated, the painting of Alma-Tadema would be an equally applicable symbol of the productive energy of the ancient Hellenes if the roll from which the rhapsodist is reading were a business document, and if the subject of rapt attention were the possibility of a profit of twenty-five per cent a year, instead of the deep-sounding harmonies of Homeric hexameter.

The study here presented arose partly as a corrective to what may be called 'hyperbolic classicism'. More particularly it was suggested by the obvious consideration that the conquest of Western Asia and Egypt by Alexander was followed by an intensive economic penetration and exploitation of this great area by Greeks and Macedonians, and that the thoroughness of that exploitation is only to be explained by definite advantages and superiorities of the conquering people which surpassed the bounds of mere military efficiency. The problem was therefore clearly set, namely, to determine, if possible, what advantages lay with the Hellenes of the fourth and the third pre-Christian centuries over their non-Hellenic contemporaries which enabled them to dominate so completely the economic and political world of that day and sphere.

Expansive energy was one of the most notable characteristics of the Greek people throughout the first pre-Christian millennium, just as it is to-day. The details of their earliest voyages of discovery into the Black Sea and westward to Italy and Sicily appear to us only in mythological form. In the wake of exploring adventurers[2] came those Greeks who colonized all the northern stretches of the Mediterranean littoral. The causes of early Greek colonization will probably always remain conjectural. The facts and the results upon the ancient world are entirely historical. In his recent brilliant article upon 'Alexander and Hellenistic Economic Life' Ulrich Wilcken has depicted Alexander the Great as one of the great historic explorers of the world[3]. In this sense Alexander was a typical Greek, however sincerely Demosthenes may have denounced his father, Philip, as un-Hellenic, a barbarian. Alexander accompanied his conquests with intensive colonization which was assuredly economic as well as military in its purpose, and quite consciously economic in Alexander's mind[4].

The first period of Greek colonization was followed by an intensive exploitation of the commercial opportunities afforded by the opening-up of new lands to

[1] <This paper was read at the Nineteenth Annual Meeting of The Classical Association of the Atlantic States, held at Swarthmore College, May 1–2, 1925. By arrangement with the author and with the editors of the Political Science Quarterly, it was published first in the latter periodical, 40.517–539 (December, 1925), virtually as it was presented to the Association. It is reprinted here with such changes only as are necessary to bring it into harmony with the style-sheet of THE CLASSICAL WEEKLY. C. K. >.

Greek energies. The hundred years stretching from the advent of Pericles as leader of Athenian politics to the accession of Philip II as King of Macedon are filled with bloody strife among the Greek city-states, accompanied by great losses in economic goods throughout the area of Hellenic control. Even these losses did not break the general economic prosperity of the Greek world. The trade with Lower Russia in Greek *objets d'art* in gold and silver remained unimpaired throughout the fourth century[5]. The Hellenic cities of Sicily and those of Asia Minor were expanding commercially. Only in Italy were the Greek cities declining in the face of the growing political power and economic advance of the native Italians[6].

The second period of Greek colonization, begun by Alexander, extended over a period of some sixty years. The Greek commercial exploitation which accompanied it and followed it differed from that of the Hellenic period subsequent to the colonization of the Black Sea and the Northern shore of the Mediterranean. In the earlier period, in so far as imperialism is to be found among the Hellenes, it had confined itself in the main to attempts on the part of the city-states to widen their dominion so as to include other Greek city-states of the same *ethnos*[7], or, at the most, more distant kin of the same Greek stock. Their exploitation of non-Hellenes had been commercial only, unaccompanied by the necessity of political domination. Within the area of inter-Hellenic city-state strife the struggle for commercial advantage enforced the bitterness already developed by differences of political viewpoint. This new combination of political and commercial causes of war found ruthless expression in Athenian politics in the year 431 B. C. in the total expulsion of the Aeginetans from their native island[8]. If Thucydides was the realist and clear thinker that he is generally supposed to have been, we may assume that, at the outbreak of the Peloponnesian War, official circles at Athens had wearied of any attempt to conciliate by just treatment the antagonism of the members of the Delian League to the imperialistic hegemony of Athens. The Athenian mission to Sparta in 432 B. C. expressed the conviction that Athens would have then been in a stronger position had it consistently used *force majeure* as its policy in the Delian League. The Athenians had come to the conclusion that compulsory rule, even if based on injustice, was a less galling form of imperialism than exploitation by a State which attempted to preserve the appearance of political equality[9]. Expressed in terms of international politics of the twentieth century, the idea is that States which, theoretically speaking, are being developed toward democracy under the mandate system will be more troublesome than those ruled under compulsion as dependencies.

Political and territorial imperialism within the circle of the Greek city-states is certainly a characteristic of the fifth and the fourth centuries B. C. The Hellenistic world is distinguished from the preceding period by one fundamental difference. Commercial exploitation had, in the previous period, been based upon the custom of tapping the resources of the Black Sea and Western Mediterranean areas by coastal colonization without actual conquest of the natives. The Macedonian-Greek colonization of Alexander and his successors was inland penetration; and its advantages for exploitation were conditioned upon, and intensified by, Macedonian dynastic control which consciously threw open to Greek business shrewdness and capacity the exploitation of great subjected areas.

If political-territorial imperialism was the basis for tremendous business advantages falling to the Macedonians and the Greeks, the capacity to extract the most out of this favored business situation lay in their great industrial-technical skill and in the superior powers of business organization which they had already developed. From 450 B. C. onward specialization of labor in the manufactories of the Hellenic urban-industrial centers had greatly increased. Here we have the testimony of Xenophon[10]:

'It is impossible for a man who is a jack-of-many-trades to do all things well. In large cities, because of the fact that many persons need each commodity, a single trade suffices for making a living, and often not even one complete trade; but one workman makes men's sandals, another women's. One person makes his living exclusively by stitching sandals, another by cutting them out. One man is exclusively a cutter of *chitons*. Another takes no part in this work, but merely puts the pieces together'[11].

With this superiority in the technique of manufacturing over the more primitive contemporary artisanship of the Persian Empire the Greeks combined a marked superiority in commercial organization. Greek commerce was founded upon and facilitated by a widespread use of coined money. In the Persian Empire the adoption of money coinage and its spread had been slow as compared with the rapidity of its acceptance in the Greek spheres of Mediterranean trade. The coinage of the Great King of Persia was not extensive. The precious metals still lay heaped up in his treasuries, to be coined only as particular necessity required. In the central districts of the Persian Empire and throughout the plateau of Iran the traditional system of barter economy still prevailed. Only on the western periphery of Asia, where Greek enterprise prevailed, or in Lycia, Cilicia, Cyprus, and along the Phoenician and Palestinian coasts, was the use of coined money extensive[12]. Egypt as a Persian province had had no separate coinage of its own before Alexander's advent[13],

[6]Beloch, Gechichte Griechenlands², III, 1,305, 314–315. For Italy see 307–308. For a different point of view with respect to the economic situation in the fourth century see Eduard Meyer, Kleine Schriften, 133. Against Meyer's view it may be said that impoverished governments and prosperous industrialists and merchants may go hand in hand. The growth of many individual fortunes, which is commonly reckoned as prosperity, often appears along with a mass increase in misery.

except for one issue by a satrap, to whom authority to mint had been delegated by the Great King[14].

The beginning of private banking as seen at Athens in the fourth century B. C., modest enough, as it actually was, is none the less symptomatic of Greek business capacity as developed under the little city-state form. The Athenian banker Pasion was much more than a mere *trapezites*, a money-changer. His business, however, was not yet a completely specialized banking business, since he was also a manufacturer. But he did receive deposits and he paid interest upon them. He made loans to merchants on sea-trade projects; and payments were made through his bank in mercantile enterprises. Deposits and withdrawals were made only in the presence of witnesses. The only written act in connection with his business was that of keeping the bank accounts of deposits and withdrawals. There was no arrangement of current accounts from which sums could be obtained, except by payment of bar money. There was, of course, no checking system, as is sometimes assumed[15]. Despite its primitive form and its very limited use of accumulated deposits, the bank of Pasion was a departure which augured well for the continuation of Greek business supremacy in the Mediterranean world.

It is also worth noting that in the century preceding Alexander's conquest of the Persian Empire the Hellenes had had experience of the pecuniary advantage to be derived from a monopolistic control by their city-states of the right to sell certain products. Such sale-monopolies, which customarily had to do with the grain supply, were usually dictated by immediate financial need and were only temporary and local in their application[16]. Yet it is clear that Aristotle was thoroughly conscious of the advantage in price-fixing to be derived from the creation of a monopoly. 'Therefore', he says[17], 'some of the cities make this a practice when they lack money. For they make a monopoly of goods for sale'. Many conditions in the world of the Greek city-states made it impossible for the development of monopolistic control of single commodities in any complete sense of the term. Yet the Greek political writer was conscious of the methods and the results of the sale-monopoly and had invented the technical term for its expression which we still use.

The technique of shipbuilding had advanced in the fourth century throughout the Mediterranean, among the free Greeks as well as among the Greeks, the Syrians, and the Phoenicians subject to Persia[18]. When Alexander conquered Western Asia Minor and the Syrian-Palestinian coast, three of the five great centers of the shipbuilding and shipping industries of the civilized world of that day were under Macedonian-Greek control. In the Western Mediterranean two centers remained, the one at Carthage, the other among the disunited Greeks of Lower Italy, Sicily, and Lower Gaul. It is a significant feature, as well as an explanation, of the Macedonian-Greek commercial exploitation of Southwestern Asia, Egypt, and the Eastern Mediterranean lands in the third pre-Christian century that a fairly complete control of shipbuilding facilities in that area then lay in the hands of the Macedonians and the Greeks.

To the evidences already suggested of the business superiority of the Greek people in the period preceding Alexander's conquest one may now add the technical development of harbor construction. A recent German study, based primarily on archaeological evidence, has brought proof that the type of harbor enclosed within the city wall is specifically a Greek development[19]. The changes of the pre-Alexandrian period had been toward the construction of moles which could serve as fortifications as well as for protection of shipping from heavy seas, and toward the construction of connected artificial double harbors. It was a harbor fortified and otherwise constructed after Greek models which helped the Syrians defy Alexander for so long in Tyre; the harbor of Sidon, and that of Carthage as well, were built on the Greek system[20].

There is no doubt that Greek engineers in the days of Philip and Alexander held the highest place in their profession, both in the theory of engineering and in its practical applications. A high degree of specialization is not to be assumed in the engineering field except in the sense that certain engineers became particularly famous in some one branch of the profession. The general term for an engineer was still, and so remained, *architecton*, or master-builder. Archytas, philosopher and statesman of Tarentum, friend and associate of Plato, was regarded in antiquity as the founder of the science of mechanics. Hippodamus of Miletus laid out the streets of the Peiraeus in the time of Pericles. Though Hippodamus developed in that and similar undertakings the type of city-plan which dominated the ancient world for centuries[21], he also bears only the general appellation of *architecton*. The city-plans of numerous colonies established by Alexander and his successors are based ultimately upon his system, as is demonstrable in the cases of Alexandria and Priene[22]. Dinocrates of Macedon, who made the measurements for the city of Alexandria, was likewise an *architecton*, and was likewise working on the system devised by Hippodamus. In engineering practice there are, indeed, indications of a small degree of specialization. Alexander assigned the work of cleaning out the underground outlets of Lake Copais to Crates of Chalcis, who is called a *metalleutes* or miner[23]. It is very doubtful that the sinking of the ventilation shafts, the deepest of which was two hundred and sixteen feet, and the original plan of the work can be ascribed to Crates. But the work assigned to him was an am-

bitious drainage project, involving to a high degree both empirical and scientific knowledge.

With great advantages, based upon superiority in business skill, technical knowledge, and mental habits of inquiry and experimentation, the Macedonians and the Greeks penetrated Western Asia and Egypt along the route of Alexander's march. What might be accomplished in the field of business enterprise with such equipment when that equipment was combined with absolute power was soon shown in the wheat manipulations of Cleomenes of Naucratis, so-called 'Satrap of Egypt', by appointment of Alexander himself[24]. As financial governor he turned to account his complete control of the grain rents and the taxes, in the following manner. In Greece a dearth of grain existed. Cleomenes forbade the export of grain from Egypt, thereby driving up prices in the cities of Greece and lowering them in Egypt. By virtue of his official position Cleomenes himself was not affected by the decree forbidding export, while the competition of the independent exporters was eliminated. Cleomenes bought up the Egyptian grain at the market price. He established a system of private communication through his agents by which knowledge of a fall in price in any given place came to them quickly. In such cases the laden ships would be diverted from those cities to which they had been originally consigned and would be sent to other localities where the price remained high.

With superiority in enterprise and in business organization the Macedonians and the Greeks flocked into Egypt in the reigns of the first two Ptolemies. They were made welcome and given every opportunity of service, in the army as mercenary soldiers, in the bureaucratic service in all manner of positions, from the highest offices to the head clerkships of the central administration. These two rulers, Ptolemy Soter and Ptolemy Philadelphus, ruled Egypt for three-quarters of a century. The first Ptolemy gives every indication of having been a man characterized by energy combined with an outstanding prudence and sense of realities. He was never tempted by the dream of Antigonus the One-Eyed to control in his single hand the great empire of the dead Alexander. At Alexander's death it was he who counselled straightway the division of the Empire among Alexander's generals[25]. It is probably to his thoroughgoing realism and common sense that we should ascribe the initiation of the economic and political policies which mark the course of the early Ptolemaic régime in Egypt.

Through the recovery of important papyri of the middle of the third century B. C. we are in a position to follow in considerable detail the methods and the plans of the second Ptolemy, and of the Greeks of all degrees who assisted him in the process of making the most of the advantages which Egypt offered them. Two outstanding sources of knowledge are the Revenue Laws of Ptolemy Philadelphus and the fortunate recovery of the archives of a Greek fortune-hunter named Zenon, who hailed from Caunus in Caria[26].

Zenon went into the service of Apollonius, the Dioecetes of Egypt, remaining with this powerful man for fifteen years, from 261 to 246 B. C., at first as a courtier in his retinue. From the year 257–256 onward he was engaged with affairs on a large estate in the Fayum which was held by Apollonius as gift land from King Ptolemy. Zenon's service was that of general manager in charge of the development and organization of this great farm, which was newly reclaimed land[27]. From 246 to 238 B. C., after the death of Ptolemy II and the disappearance of Apollonius, Zenon still appears as a prosperous man engaged in large affairs of his own in the Fayum. In the Zenon correspondence we see an amazing number of Greeks who revolve about the central figure of Apollonius, all engaged in a complicated round of business activities. It is difficult to separate their activities, official, semi-official, and private, one from the other. These Greeks were not producers. They were managers of official departments, exploiters of the wealth of Egypt and of the labor of its people, whether as officials or lining their own nests. One of the more recent letters published by Edgar indicates how these Greeks followed one another into the Arsinoite Nome (the Fayum), as into a land of golden opportunity. There was no fixed immigration quota to bar anybody.

Plato to Zenon greeting. The bearer of this letter to you is Demetrius. It seems that his father happens to be making his living in the Arsinoite Nome. The lad therefore wishes also to get some employment there; and as he has heard that you were a kindly man, some of his friends have asked me to write to you regarding him in order that you may appoint him somewhere in your district. Please therefore do me this favor and see that he gets something to do, whatever you may judge him fitted for; and look after him otherwise if he is useful to you[28].

This lad Demetrius did not begin at the bottom, as do the Demetriuses who come to us, and work upward. He started near the top. It is worth noting that the approach of this lad to Zenon was through a man who knew neither Demetrius himself nor his father. It was through friends who knew Plato, who in turn stood in close business relations with Zenon, that he obtained his recommendation.

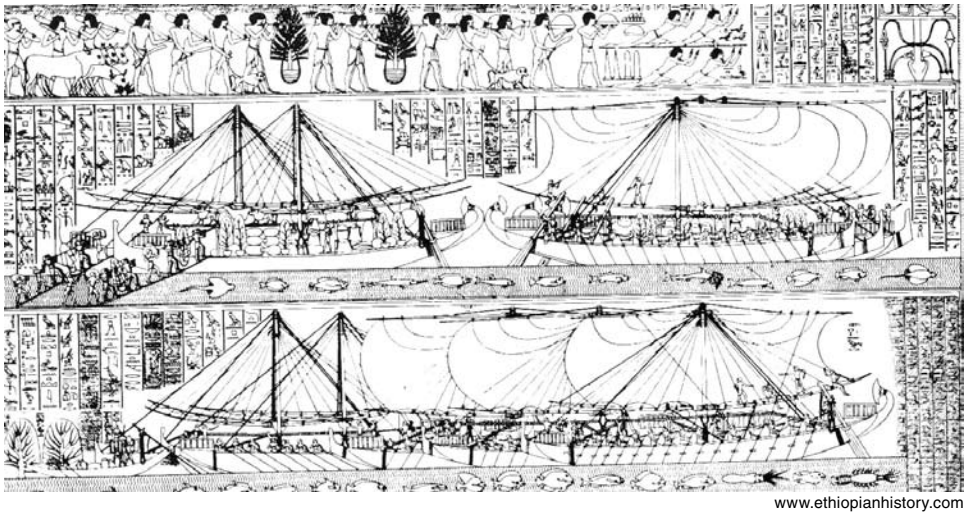
Where Is Punt, the 'Land of God'?

by Rick Sanders

In late 2006, archaeologists excavating man-made caves on the coast of the Red Sea found well-preserved cedar timbers, together with limestone block-anchors, curved cedar steering oars, rigging ropes of sea-going vessels dating back 3,800 years old, buried at what is today called Wadi Gawasis, near what was a port on the Red Sea in pharaonic times.[1]

Also found were references to the "Land of God," or Punt, which caused more than a little excitement, since the very existence of Punt had become obscured in the mists of the time.



www.ethiopianhistory.com

Egyptian boats depicted on the wall of the funerary temple of Queen Hatshepsut in the Eighteenth Dynasty (1540-1304 B.C.). The largest expedition during her dynasty had at least five large ships, with 30 oarsmen in each, on a journey that lasted three years.

The question that has not yet been answered is: Where is Punt? Egyptian scholars do not agree on its location: The University of Cairo says it's Yemen, Somalia, Ethiopia, Eritrea, or Sudan. Others add Zimbabwe, Hadhramaut, or India. But in our judgment, even India is too close, for none of these destinations would require a return trip of three years, which is the time agreed upon by most Egyptian historical sources for the journey to and from Punt. Nor would you need 10,000 men, the number cited by historical sources.

And then there's the question of the minerals that the Egyptians brought back from Punt—antimony and gold. The nearest antimony to Egypt is only 3,000 miles away, in Madagascar. But where did the gold come from?

As you will see below, the late Paul Gallez, an ancient map scholar, believed that the land of Punt was in the Puno region of Peru. The geographer, historian, intellectual troublemaker, and Barry Fell associate, George F. Carter[2] translated a work from German by H. Quiring, who believes that Punt was the island of Sumatra, where the Egyptians mined gold between 1200 and 500 B.C.

Quiring mentioned two French sinologists, Pauthier and Bazin, who reported that in 1113 B.C., the Chinese emperor Chou-Kung received ambassadors from the kingdom of Ni-li, probably Egyptians, who had made a long voyage in "swimming houses" and who could determine their position by means of observation of the Sun and heavenly bodies. Carter then did a calculation, taking the average speed of a ship during the 1600s (from Francesco Carletti's *My Voyage Around the World*), and concluded that in three years you could go around the world at a leisurely pace. Therefore, Punt could be half the world away.

Nito Verdera, the Ibizan journalist and indefatigable investigator of Christopher Columbus, has summarized the theory of his historian friend, the now deceased Paul Gallez,[3] which he has given us permission to include here.

Nito Verdera: The Egyptian Theory

"In *La Cola del Dragón,* Paul Gallez tells us that the theory referring to the earliest travels to distant lands as yet not identified with total certainty, is that of the expeditions to the Land of Punt (Richard Hennig, *Terrae Incognitae,* 4 vols, Leiden, Brill 1950, in vol. I, pages 5-13). The first known voyage to this region is that organised by the pharaoh Sahure of the fifth dynasty (circa 2550 B.C.). His ships brought back incense, myrrh, gold, silver, precious woods and slaves from Punt and the many other lands and islands they called at during the voyage. Not all these items came from the Land

Paul Gallez, an expert in ancient maps, located Punt in Peru.

of Punt, so we do not have to look for just one country producing all these riches.

"The pharaoh Asa (Isesi) followed Sahure's example, and around 2400 B.C. he also sent out his fleets to the Land of Punt. One of the princesses of the sixth dynasty was placed in her tomb, ready for her journey to the Land of the Dead, wearing a lip colouring with an antimony base, though this metal was totally unknown in Egypt and any of its neighbouring countries. The stone on the tomb of Knemhopet, a pilot from the island of Elephantine who had been on eleven voyages to the Land of Punt, dates back to the same period. . . ."

"The best-known and possibly the most fruitful voyages, are those organised by Queen Hatshepsut (also called Hacheput, Hatcheposut, Huschpeswa, Hatashopsitu, Hachepsowe, Hatasuput and Hatscheposut, 1501-1482 B.C.) whose deeds are engraved in the temple of Deir-el-Bahari, which she herself ordered to be built in Thebes to honour Amen-Ra. Hatshepsut's main expedition was made up of at least five large ships with thirty oarsmen in each of them. They sailed from somewhere on the Red Sea and were away for three years.

"One of the inscriptions in the temple of Deir-el-Bahari reads: *'The inhabitants of Punt asked: How have you reached this country unknown to man? Have you flown here through the sky, or have you sailed across the Great Ocean from the Land of the Gods?'* (Richard Hennig: *Terrae Incognitae,* 4 vols, Leiden, Brill 1950, I, 5, Ophir). . . .

"How can one not feel tempted by interpretations that immediately spring to mind and would seem to give each other mutual support? The expression 'Great Ocean' is what we know today as the Pacific Ocean. The Land of the Gods is the name given to the West in all mythologies, which would place the Pacific to the west of Punt and would therefore place Punt in America.

"According to the tales of the life of Ramses IV in the Harris Papyrus kept in the British Library, the pharaoh Ramses III sent an expedition of 10,000 men to Punt in 1180 B.C. The last expedition that we know of, which set off at around the middle of the second century B.C., was arranged with the help of traders and bankers from Massilia, our modern-day Marseilles (Hans Philip: article on "Massilia" in Pauly's *Real-Encylopädie der classichen Altertumswissenschaft*/ XIV/2, Stuttgart, Druckenmüller,1930).

"The Egyptian ships built for ocean going were about thirty meters long and up to eighty-five tons in capacity. Under favorable weather conditions, their flat bottoms enabled them to sail at great speed. When the wind dropped, the oarsmen would take over the job of propelling the vessel, so that the voyage could continue without having to wait for a change of wind.

"Egyptian scholars do not agree on the location of the Land of Punt. Some of them suggest Eritrea, others Somalia, Zimbabwe, Hadhramaut, or India. However, all these places are far too close to the Red Sea to justify the length of the voyage; three years according to all the relevant Egyptian records.

Paul Gallez: Punt Is in Peru

"In his article 'Trois thèses de predecouverte de l'Amerique du Sud par le Pacifique' (*Gesnerus* 33, 1976, Aarau, Zurich), Paul Gallez offers a new interpretation. He locates the Land of Punt in South America, probably, in the Puno region of Peru, on the shores of Lake Titicaca. 70% of Peru's annual gold pro-

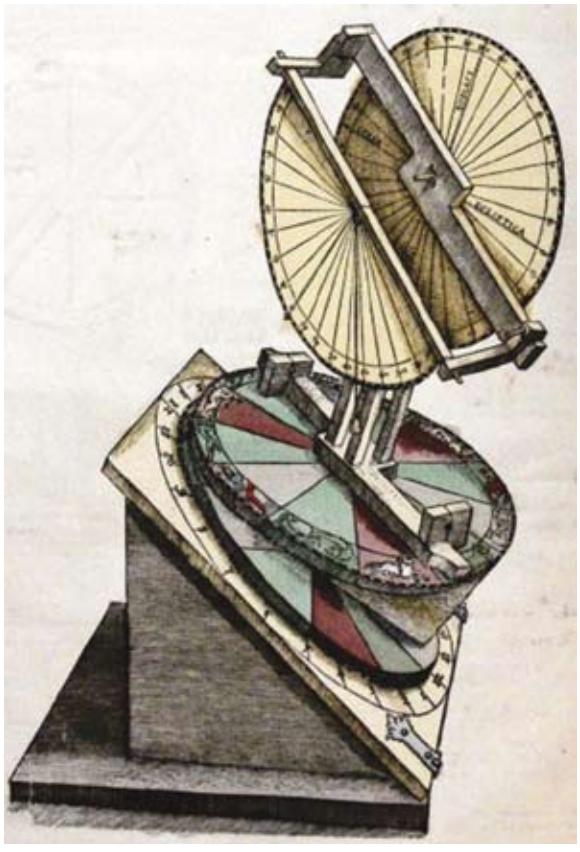
This drawing by Maui of his tanawa or calculator, was found in the Caves of the Navigators, Sosorra, Irian Jaya (West New Guinea). The tanawa serves as an analog computer, integrating three different measurements.



The tanawa, or torquetum, as pictured centuries after Maui.

Rick Sanders

The degree circle on a recent torquetum built by the author. The torquetum was used to determine longitude and the equatorial circumference of the Earth using lunar distances.

duction comes from there, together with antimony, mercury, zinc, tin, and cobalt. Old gold and antimony mines can be found in the area, though archaeologists disagree as to their exact age. The boats used to sail on Lake Titicaca, made of *cat-tail* (a long-stemmed, reed-like, grassy plant of the Typhaceous family with a cylindrical ear) are so similar to those used in ancient Egypt that Thor Heyerdahl went to Puno to recruit workers to build him his papyrus boat Ra II on the banks of the Nile."

Astrogation

We need not be surprised at all this since as long ago as the 19th Century B.C., Pharaoh Senusret II built a canal that connected the river Nile to the Red Sea, a canal which has survived until the present day as an irrigation canal. Herodotus tells us that the pharaoh Necho II (circa 600 B.C.) sent out a fleet which took three years to circumnavigate Africa (clockwise).

There is much other evidence of Egyptian voyages to the Americas, as *21st Century* has reported in previous issues.[4]

In 232 B.C., Captain Rata and Navigator Maui set out with a flotilla of ships from Egypt in an attempt to circumnavigate the Earth. The Maui expedition was under the guidance of Eratosthenes, the great scientist who was also the chief librarian of the library at Alexandria.

This expedition left cave drawings discovered in modern times, showing one of the navigational instruments, a tanawa (or torquetum as it later became known) which Maui had brought with him, along with an inscription deciphered in the 1970s by epigrapher Barry Fell: "The Earth is tilted. Therefore, the signs of half of the ecliptic watch over the south, the other (half) rise in the ascendant. This is the calculator of Maui."

At that time, Eratosthenes had just measured the polar circumference of the Earth. Finding your latitude is easy, but finding your longitude, and the cir-

_____, "Was the Antikythera an Ancient Instrument for Longitude Determination?," *21st Century,* Spring 2003 http://www.21stcenturysciencetech.com/ articles/Spring03/Antikythera.html

Stonehenge: Remnants of an orderly circular arrangement of posts and marker stones, dating to about 2600 B.C., give evidence that Stonehenge was a sophisticated luni-solar observatory, capable of eclipse prediction among other measurements. Imagine the half-degree marks on the edge of the torquetum's equatorial circle as each representing a vertical post in the Stonehenge observatory.

cumference of the Earth near the equator, as a function of your latitude and the equatorial circumference, is difficult. We know that Maui was thinking about this, because his cave drawings also include a proof of Eratosthenes' experiment to measure the Earth's circumference.

Our hypothesis is that the torquetum was used to determine longitude and the equatorial circumference of the Earth using lunar distances. To do that job, the navigator would have to carry with him an almanac that gave the lunar distances from prominent places for each relevant night of the year, for about 19 years.

Ancient Observatories

We have no proof yet that those almanacs existed, but we do know that the data required could be provided by a conceptual use of the Great Pyramid in Egypt and the Stonehenge, built so close to each other in time (2450 and 2300 B.C. respectively), and of some of the South American pyramids built in the same rough time frame. Imagine the little lines representing the half degrees on the edge of the torquetum's equatorial circle as all representing huge vertical posts or stones.

The torquetum could also be used to gather data sufficient to predict eclipses, which are a relatively easy way to find your relative longitude (unfortunately, they are very infrequent). All you have to have is a relatively precise local *time* of observation of the eclipse at two points, east and west of each other.

The most famous example of finding relative longitude is the eclipse which took place during the battle of Arbela (in ancient Assyria), Sept. 20, 331 B.C., recorded at both Arbela and Carthage (Tunisia)—at the "fifth hour" at Arbela and the "second hour" at Carthage, which would put Carthage at the approximately correct 45 degrees west of Arbela.

Now, if you can predict eclipses, you can send out expeditions to observe them and kindred events as we have done many times in the last 500 years. Kepler's Rudolphine tables predicted the transit of Mercury for Nov. 7, 1631, and he encouraged observers to be on the lookout for it. Because of the bad weather, only three people saw it, but that was the first time in human history.

Captain Cook's long trip to the South Seas (1769) to observe the transit of Venus is another case in point. These events can be used to determine longitude, and to evaluate various methods used to determine longitude; and also measure the absolute distance of the planets from the Sun.

So do not look around the corner for the land of Punt; it might be halfway around the world. Man, as Lyndon LaRouche keeps reminding us, and as his Youth Movement has demonstrated, is not a monkey.

Pastoral Nomadism in Arabia: Ethnoarchaeology and the Archaeological Record—A Case Study

Juris Zarins
Southwest Missouri State University

Over the course of approximately two decades, archaeologists have suggested that the archaeological record of much of the Arabian peninsula *sensu lato* has left for us traces of the origin and development of pastoral nomadism. We have suggested elsewhere (Zarins 1989, in press) that this development can be seen in four broad phases: 1. Origin (6000–4000 B.C.), 2. Early Florescence (4000–2000 B.C.), 3. Transition (2000–1000 B.C.), and 4. Arab Bedouin (1000 B.C.–present). The confirmation of this development has been reinforced both by historical sources, the geological record, faunal/floral studies, and by on-going archaeological work peripheral to pastoral nomadism itself.

Our understanding of the cultural process within the peninsula has been hampered by the lack of detailed studies concerning the modern Bedouin from an ethnoarchaeological point of view and the lack of appropriate ethnological models for perceived lifestyles in the distant record beginning ca. 6000 B.C. Concerning the first point, only recently have we seen any attempt to address the specific needs of the archaeologist vis-à-vis pastoral nomads.

The now-classic studies of ethnoarchaeology have dealt with primarily hunter-gatherers such as the Bushmen (Yellen 1977), the Australian aborigines (Gould 1980) and the Eskimos (Binford 1978; Chang 1988) or even sedentary agriculturalists (Longacre 1970; Hill 1970). Recent refinements on the nature and meaning of the discipline have been building in ever-increasing crescendos (Gorecki 1985; Binford 1985; Gould 1985). Regarding pastoral nomads, one of the earliest studies involved a study of the Lur of southwest Khuzistan (Hole 1978). Here the author attempted to link the modern sheep/goat pastoralists of the region to an 8,000 year old archaeological record (Hole 1972, 1979). Subsequent work in the region has operated along the same guidelines and assumptions (Henrickson 1983; Zagarell 1982; Gilbert 1983; Alizadeh 1988). Ethnoarchaeological studies of camel bedouin have been even rarer. Initial opinions on cultural process were based on ethnographic study or historical data modeling (Dostal 1959, 1979; Eph'al 1981; Bulliet 1975; Briant 1982). The actual work of examining North Arabian camel nomads from the ethnoarchaeological perspective has been sporadic. Studies in the Negev, the Beidha area of Jordan (Banning and Köhler-Rollefson 1983; Köhler-Rollefson 1987), Qatar (Montigny 1978) and the Najd (Zarins et al. 1980: pl. 11) have defined modern campsites but have spent little effort in relating the living population to the material record (Lancaster 1981:10–14, Figures 1, 2). In addition, selected ^{14}C dates from sites in the Jebel Qara (sixteenth century A.D.), the recovered archaeological data from amorphous sites, and the historical data from the Sinai

(Bailey 1985) open up the real possibility of sketching a tentative cultural model for the north Arabian camel bedouin spanning at least a millennium (Zarins et al. 1980: 20–23).

Our principal concern involves an attempt to comprehend the archaeological record from more remote periods, but still within the defining framework of pastoral nomadism. Therefore the Southwest Asian Pastoral Technocomplex which we defined requires an appropriate ethnographic response in order to suggest a reconstructible life pattern for the period involved. Since the data we are seeking are disparate in time and space, the analogy method is the one utilized most often for investigation (Stiles 1977: 94–95). Based on this approach, we hope to examine the hypothesis that the pastoral technocomplex essentially revolved around cattle pastoralism. Clearly, our attempts to evaluate this thesis will center around a vastly different geomorphological, ecological and climatic scenario. To this end, examining some of the only non-Arabic speaking Semitic populations of the peninsula holds real promise. Some five different linguistic groups occupy today what is part of the People's Democratic Republic of Yemen and Oman and our attention will be focused on the largest group, the Mehri who today number over 60,000 (Figure 1; Lonnet personal communication; Bergstrasser 1983:151–160; Johnstone 1975). We hope that an analysis of the particular geographical and ecological factors governing their way of life will shed significant light on the early archaeological record of the larger northern Arabian peninsula.

The Southwest Asian Pastoral Technocomplex

As the result of work begun in the 1950s but largely brought into proper focus during the 1970s, we were able to discern an archaeological cultural area delimited by the presence of the current 250 mm rainfall isohyet (Zarins 1989a, Figure 14.2). This "technocomplex" (Clarke 1968:338-43) consists of many archaeological facets, some of which can be said to constitute the backbone of the entire period in question.

Stone circles are most common and, as expected, vary widely in type and construction. They may be simple or complex, incorporating internal subdivisions and/or attached external lines. They can be part of larger, designed, interlocking structures such as an integrated circle or form very large isolated circles of more than 60 m in diameter. In their smallest configuration they form a "homestead" in which two or three joined circles form the basis of a site. At the other extreme, elements can stretch as one seemingly coherent site for over four km. Individual circles vary in size from 3 to 5 m in diameter with walls composed of two to ten courses of stone built in dry wall fashion. Many have a semi-subterranean effect. Vertical slabs were used for the definition of the doorway, threshold, and internal subdivisions. Stone pillars in the center suggest a base for support of a superstructure.

Tumuli are a second major component, occurring as isolated tomb fields or as integral parts of stone circle complexes. Many are placed on convenient stone outcrop plateaus or on prominent ridgelines visible from long distances. Their typology can be broken down into several conventional types. Perhaps the most spectacular aspect of the region are the large-scale structures called *"Desert Kites,"* so-named because from the air their configuration appears to most closely resemble a flying kite with a tail. Single kite structures with walls over 1 km long and an enclosing head have been found in isolation or incorporated in a series of attached kites which could be linked for over 20 to 50 km. Although their function remains problematic, many researchers suggest they served as game traps. A more exotic aspect of the technocomplex includes *"pillars"* and *"platforms."* These structures were noted at many sites occurring with the other structural elements. Often, stone-built platforms filled with stones and cleared pavements also seem to be related.

Rock art in a number of distinctive phases is also associated with the broad spread of the technocomplex. To properly interpret the functions of these structures and reconstruct a viable way of life for the people of the area requires not only a detailed analysis of the data but also a suitable ethnographic model. Therefore, the Mehri, a group perhaps stretching back historically to the early centuries A.D., may represent a compromise solution in terms of structural analysis.

The Mehri—Cattle Pastoralists of the Southern Arabian Peninsula

The Mehri occupy a small, but significant territory in Dhofar principally along the seaward slope of the Dhofar range (Figure 1). Their settlement takes advantage of the humid, monsoon climate and their way of life is largely dominated by the monsoonal pattern. The cool mountain climate and the precipitation generated by the three month monsoon is essential to their survival. The presence of good grazing land on the plateaus allows extensive cattle breeding, a unique phenomenon currently on the Arabian peninsula. The Mehri, based on these factors, engage in a limited vertical, short-range pastoralism. According to Janzen (1986), the annual round can be broken down as follows:

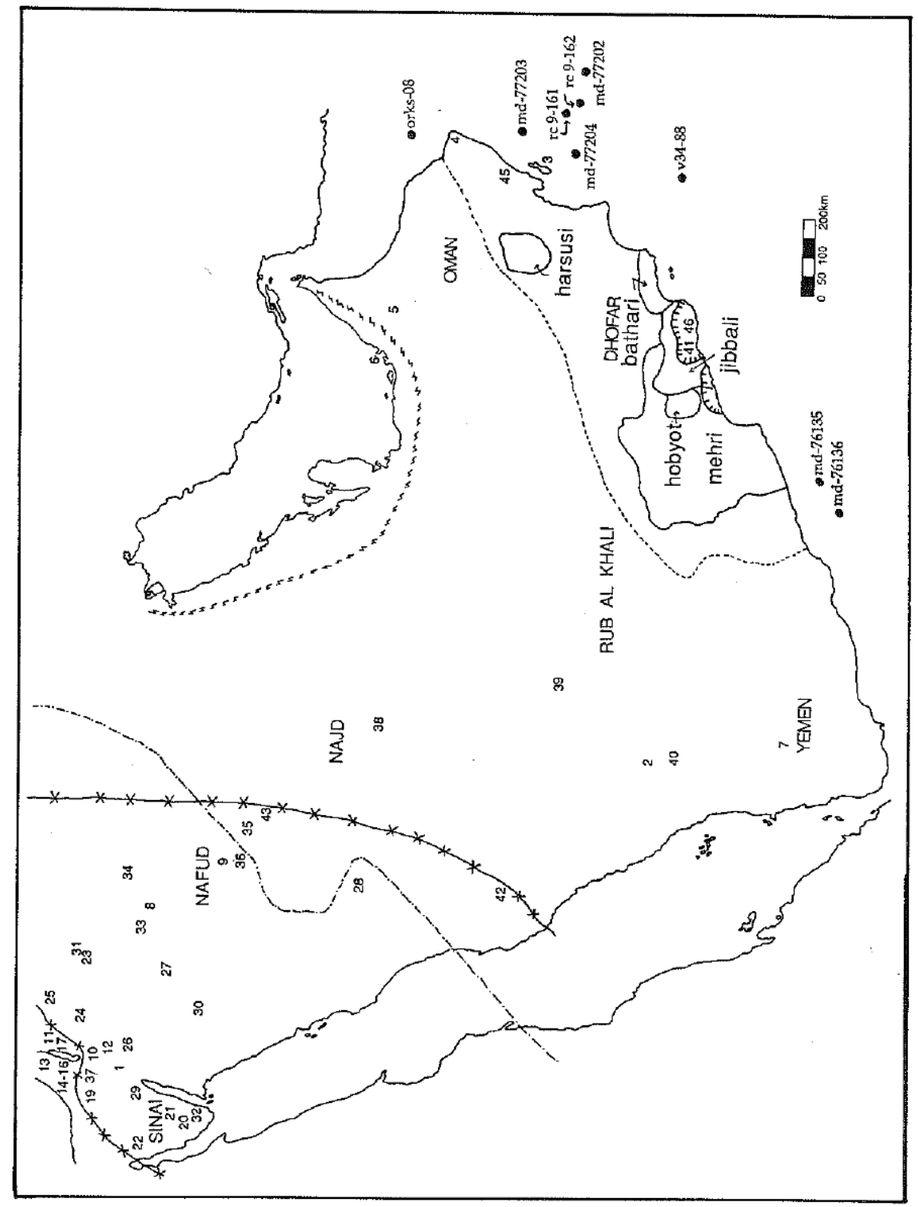

Figure 1. The Mehri and Related Archaeological and Geomorphological Locations within the Arabian peninsula, 7000-1000 B.C. 1. Beidha 2. Jabal Qara 3. Masirah Island 4. Ras al Junayz 5. Hili 6. June-September	Monsoon period (fixed, main settlement)
September-November	Post-monsoon season (temporary camp)
November-March	Dry winter months (fixed, main settlement)
April-June	Pre-monsoon months (temporary camp)

In essence, while four moves are made, the focus is on two distinct settlements—a temporary camp used twice during the year and a main fixed camp for the remainder. The principal animal herded, short-horned *Bos taurus* is used essentially for the procurement of secondary products which vary in quantity during the year depending on climatic conditions. The maintenance of approximately fifty head of cattle per family seems to have been the norm prior to the last civil war in the region.

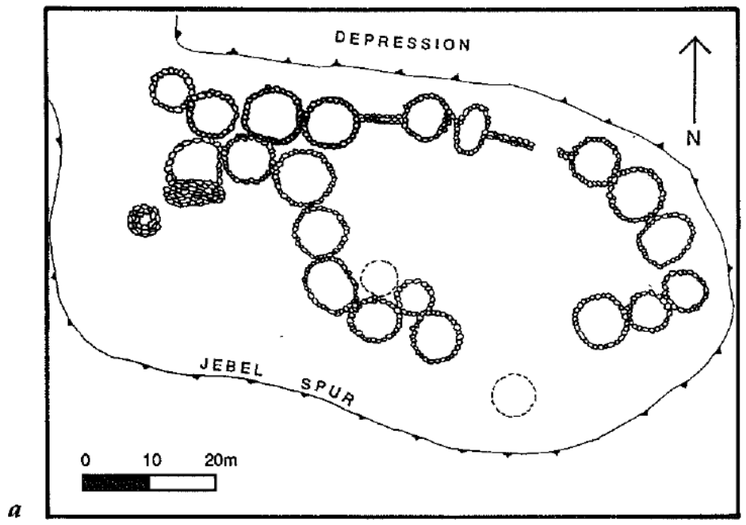
Based on the type of animal herded and the strategy necessary to obtain constant water and fodder, the Mehri have developed two different architectural styles and plans for their settlements. The fixed, main, or permanent settlements are to be found on the edge of wadis and favored plateaus. Particularly favorable locales are protected rises in wadi floors. Group settlements predominate in communal, extended family economies. The compact, massed formations allow cattle free access to individual homesteads and still allow space for communal feeding and milking. The group settlement is surrounded by stone or thorn brush banks to prevent cattle straying. Each house is circular and approximately 4–5 m in diameter. It contains a single nuclear family averaging five members. The base wall is 80 cm high constructed of large stones and earth. The house has a central post well dug into the ground. Strong, gnarled branches are the roof bearing members with the lower ends on the base wall and the upper ends locked on the center post. Gaps are filled with thinner, cross-wise branches. Thick grasses cover the rounded roof in a thatch. Dung is often mixed in and extra stones and wood are added for weight. One door is present with a near-by hearth. The house is compartmentalized into a larger sleeping area and a smaller storage and kitchen area (Figures 2b, 3a).

The cattle byres are somewhat different. Three types are found. Byres for large and small calves match the size of the human dwellings but those for adult cattle are much larger. For the latter, byres in excess of 20 m in diameter are not rare. These are capable of accommodating 100 cattle. An average 10 m byre can hold 40–50 head of cattle. The byres are distinguished in construction from human houses by a flatter roof, more dung in the roof to conserve body heat and several posts. Base walls are thicker and cut into the limestone floor. The three types of byres are found in close proximity to each other in order to save labor and conserve heat. The youngest calves' byres are placed between the largest byre and the owner's home due to the extra care required for their maintenance. Unusually large byres are placed outside the homestead for reasons of space and insect control. Byres are also owned by a single family and only the largest are communal property for ease of milking, feeding, and care (Figures 2b, 3a).

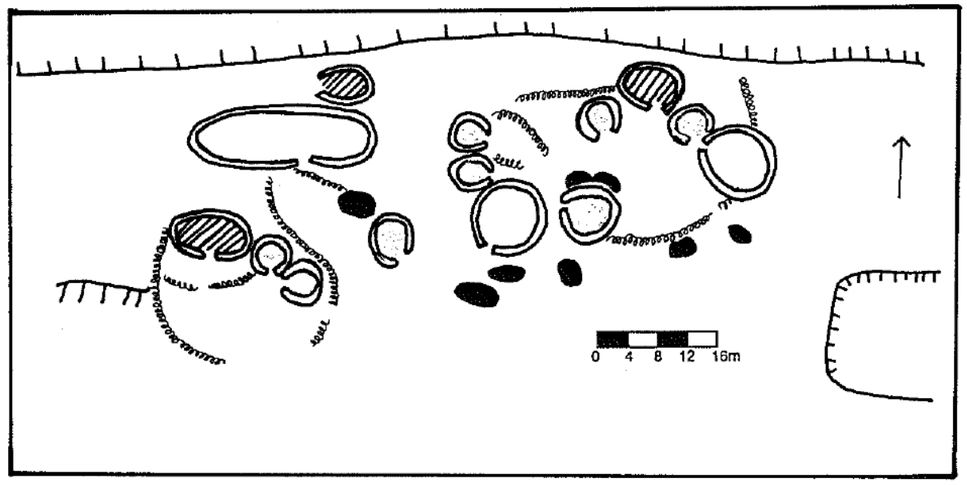
The temporary camps have a somewhat different arrangement and construction. The homesteads are nuclear and surrounded by a bank of thorn twigs. Inside the hedge are three buildings—the largest is the living quarters (3–4 m diameter) and the other two are calf byres. Mature cattle are kept in the open during the temporary camp season and are herded at night into the communal area for milking. The structures here are very light and temporary. A wooden framework is made of poles rammed into the ground in a circular pattern. The tops are tied together and twigs are interwoven for the sides. A grass cover is often added. Hearths are built outside the dwellings (Figure 3b).

A final unique feature of the Mehri system is the presence of monsoon-rain fields. While at first glance they look like cattle enclosures, they are large irregular areas enclosed by thick walls 1 m high to keep cattle out. The wadi edges are seen as favorable locales having fine soil easily aerated. Headlands are preserved for cattle grazing. The fields are several hundred m in size and planted by digging stick in mid-June to mid-October. After the crop, often sorghum or millet, is harvested, the cattle are driven onto the field for dung fertilizer and fodder (Figures 2b, 3a).

While the present-day Mehri occupy a small and unique range, Dostal has suggested on the basis of linguistic reconstruction that for the prior 1,000 years their territory may have been considerably larger, especially in the Oman direction (Dostal 1967: Figure 19 and historic summary: 123–135) (Figure 1). Certainly this might mean that the summer monsoon influenced the area more effectively than present (see below; Warren et al. 1987). In fact, recent archaeological work suggests that the Mehri way of life may have its roots along the eastern shores of the Arabian peninsula. The stone circle complexes of Masirah Island (A. Shanfari 1987) and Ras al Junayz (site RJ1; cf. Mariani 1985:36–41; Biagi 1988:5–10) may provide the more immediate archaeological parallels for the third and second millennia B.C. Cattle pastoralism along the southern coast of Arabia may well have come from one of two different sources. First,



a



b

Figure 2. a) Site 200-108, Wadi Fuhah, Midian. b) Arqetan, Mehri Monsoon and Winter Settlement (after Janzen 1986:Figure 30. Slash marks = dwellings; remaining structures = animal pens; black areas = dung heaps; looped lines = brushwood enclosures).

domestic cattle are known from the Ubaid period settlements of Eastern Arabia *sensu lato* from at least the middle fifth millennium B.C. (Zeder in Masry 1974) and are also attested from Ras al Junayz possibly as early as the late fourth millennium B.C. (Bökönyi n.d.). Domestic cattle were also identified at the oasis site of Hili beginning from the early third millennium B.C. (Cleuziou 1982:19). Thus, domestic *Bos taurus* may have filtered into the southern coast from a northeastern direction as suggested by Dostal's reconstruction of Mehri place names (Dostal 1967: Figure 19). The other possibility involves the direct transference of *Bos indicus* from India. According to Hoch, the cattle remains at Umm an Nar are the zebu type and would date to the midddle third millennium B.C. (Hoch 1979:613–616). In either reconstruction,

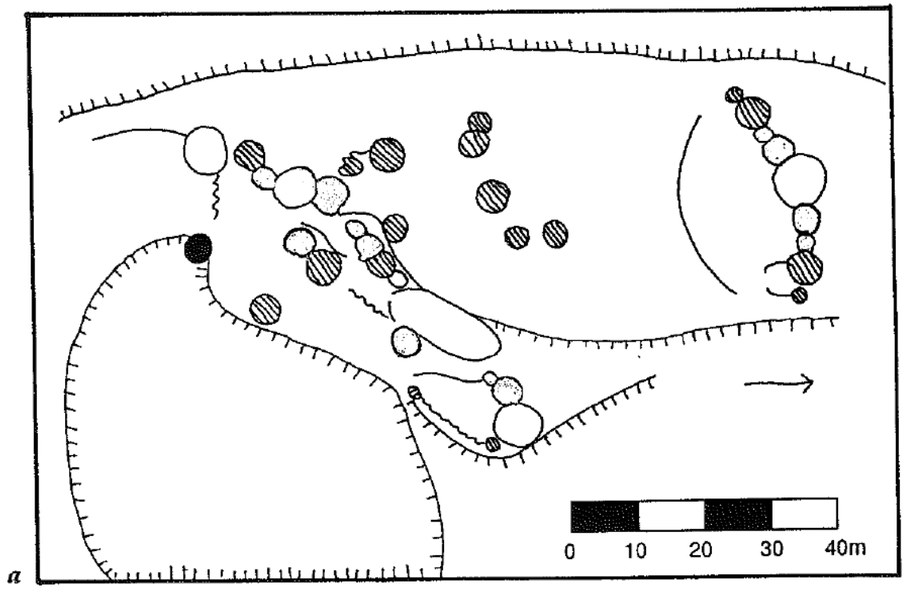


Figure 3. a) Kefoz Theroz. Mehri Monsoon and Winter Settlement (after Janzen 1986: Figures 31-32. Slash marks = dwellings; open circles = animal pens; black circle = ruined building). b) Hidhalm. Mehri Pre- and Post-Monsoon Camp. (after Janzen 1986:Figure 34).

Mehri cattle pastoralism represents a way of life derived from the northeast via Oman, and one specially adapted to the summer monsoon.

Archaeological Considerations

The linchpin on which Mehri life hinges is the summer monsoon (Figure 1). Without the ameliorating effects of this phenomenon, cattle pastoralism could not be practiced in the region. Therefore, to suggest that distant prehistoric pastoral nomads of the peninsula practiced a similar way of life based on cattle pastoralism, would invite an examination of the past effects of the summer monsoon on the peninsula.

In a series of papers Kutzbach and colleagues projected a significant improvement of the summer monsoon over India and Arabia based on the earth's orbital variations and solar radiation changes (Milankovitch forcing) in varied periods of the earth's past (Kutzbach 1981; Kutzbach and Otto-Bliesner 1982:1181–1182; Kutzbach and Street-Perrott 1985; Prell 1984). The last major period of improved summer monsoon circulation was suggested to span the early Holocene ca. 8000 B.C. to 3000 B.C. This modelling has been largely reinforced by a series of independent marine and land observations. A study of the western Arabian Sea core MD 76 135 (Figure 1) concluded that during the early Holocene ca. 6000 B.C. the climate was characterized by highly increased amounts of humid tropical and Sudano-Sahel savannah taxa indicating a stronger southwest monsoonal flow over Arabia. The associated planktonic assemblage pointed to lower sea surface temperatures at the time and thus again a stronger southwest monsoonal air flow (Van Campo et al. 1982:57–59). Separate studies of sea cores on the western shores of India again confirmed the idea that the peak of the monsoonal activity in the western Arabian sea occurred at 6000 B.C. (Van Campo 1986:385).

Several studies on the wadi systems and lake beds of the Rub al Khali and the southwestern Arabian plateau support these conclusions. McClure notes that "a northerly displacement of the southwest monsoon in the Holocene resulted in a sub pluvial phase in the Rub al Khali from 7000–4000 B.C. (McClure 1978:262; 1984:209–211; see also El Moslimany 1983:171, 174, 186, 188). Examination of the Wahiba sands of southern Oman along the Arabian Sea found alluvial fans (Wadi Batha), raised channels (Wadi Andam), and raised terraces. These have been attributed to a humid phase, ca. 9000–6000 B.P. possibly associated with the increased summer monsoon (Warren et al. 1987:66). Whitney, examining the wadi and lake deposits in western Arabia, principally the tufa, fine grain alluvium, soil carbonates and lacustrine deposits, noted that the southwest monsoon caused an increased moisture zone from south to north and that the monsoon had been deflected north from its present path (Figure 1). The moisture effects in the summer were gentle and persistent rains enhancing the local ground water tables. The time frame suggested for this climatic improvement lies between 7000–3000 B.C. (Whitney 1983:43, 50, 56, 76, 81). How far north within the peninsula were these effects felt? According to Whitney, the monsoon may have had an effect as far north as the southern Nafud. This suggestion was made on the basis of prevailing wind patterns in North Arabia and the geometry of the current 50 mm isohyet in the northern Hijaz (Whitney 1983:76). A radiocarbon date for the active lake deposits at Jubba in the southern Nafud may support this conclusion (Garrard et al. 1981:139–141). Further to the northeast, within the Shatt al Arab region of the Persian-Arab Gulf, el-Moslimany suggests that the remains of diatoms and pollen from ponds and lakes suggests that increased summer precipitation was due to the southern monsoonal system which extended as far north as the head of the Gulf (1983:133, 142; 1984:115–6). (Sarnthein [1978:45] proposes that this northern limit of the southeastern monsoon was maintained until 3000 B.C.). This phenomenon may have occurred due to intensified summer insulation (El Moslimany 1984:115).

Finally, while we may suggest that the summer monsoonal pattern may have extended its effects as far north as the Nafud and Persian Gulf, the considerable climatic amelioration in the Negev/Sinai and Jordan may be explained by other climatic forces emanating from the Sahara monsoon and Eastern Mediterranean cyclonic systems (Goodfriend 1987:389–90; Rosen 1987:48). However, in contrast to examining the effects of the summer monsoon on the Arabian peninsula, the climatic work on Negev/Sinai sites suggests that it was winter precipitation which was the key to enhanced transhumant pastoralism (Cohen and Dever 1978:40–41; 1980:57; 1981:66, 74). Similarly, Betts proposes that the main eastern Jordanian sites were principally occupied during the winter (Betts 1988:9; 1989:13). Work in the Sinai suggests a model based on stable, larger winter settlements and high elevation, smaller, flimsier summer settlements (Bar-Yosef 1984:151, 157; Beit-Arieh 1986:45). It would be most interesting then to examine the relationship between possibly divergent lifestyles based on the precipitation cycles of north Arabia vs. south Arabia. Possibly the line of separation would have paralleled our original southern technocomplex line (Zarins 1989a:Figure 14.2). Thus, the technocomplex, as we outlined it would have been characterized

pattern in the archaeological examples? The Sinai, Arabian, and Yemen examples appear to confirm this idea, especially in the differential size of adjoining circles (Figures 2a, 4b, 5b-c, 6a, 8b,). Another interesting point is the observation by Janzen that the large mature cattle byres were often placed away from the camp site. The jellyfish as defined by Betts may be the large byres with the actual campsites located further away surrounding the byre (see the aerial photo layout in Betts 1980:89). Even more relevant parallel structures have been recorded from central Arabia, situated on identical headland locations, but they may date in most cases to later periods than that discussed here (Zarins et al. 1979:pl. 7; 1980:pl. 5).

The second type of structural patterning can be exemplified by the Mehri site of Kefoz Theroz (Figure 3a). In this case, the camp consists of agglutinative groupings interspersing residences with cattle dwellings of different sizes. The major sites of 201-56 in the Wadi Sirhan and 201-15 in the Arar drainage may be representative (Parr et al. 1978:38; Adams et al. 1977:pl.18c). In these cases, the large central circle with attached smaller interlocking circles may reflect the Kefoz Theroz type of central cattle byre and smaller units for calves of various types. This type is also found in the Sinai (Figures 5a, 5c). From the Negev (Figure 6b), at Bir Resisim, a similar pattern can be suggested based on excavations. The larger structures which may be the mature cattle byres had as many as four pillars.

The smaller and more temporary Mehri sites such as Hidhalm (Figure 8b) may be paralleled by smaller clusters of stone circles such as those at 206-40 in the Arar area, and not representative of the jellyfish or interlocking style. They can be considered flimsier and therefore may be the summer type (Bar-Yosef 1984:157). Similar small encampments can be found in the Sinai and Negev (Figure 5c; Beit-Arieh 1986:45).

Structural comparisons also include observations on construction. Janzen noted the many details of construction involving both organic and inorganic materials. Bar-Yosef suggests that the S. Sinai Neolithic examples had an organic superstructure and occasionally stone shelves in the side walls. Betts in eastern Jordan noted that the structures in some cases retained the corbelled effect and on occasion had stone roofs (Betts 1988:25; 1983:10). The three-season excavations at Bir Resisim yielded detailed information on construction techniques in the EB IV period and suggested a roof constructed of both timbers and flat stones (Cohen and Dever 1981:58ff.).

Finally, the Mehri summer monsoon rain fields which have enclosure walls to keep out cattle may be duplicated at 206-1 in the Hail area (Figure 7b). Here the large, irregular enclosed area sits between two jebels providing maximum runoff. The re-used kite, 205-8, south of the Nafud may also belong here (Figure 7a). In the Negev, while the investigators postulated the presence of agricultural fields at Bir Resisim, no similar structures have been reported (Cohen and Dever 1979:44; 1981:70).

Comparisons and Conclusions

Having looked at the Mehri example and studied the archaeological evidence from the northern Arabian peninsula, what can we say which would resolve the question of species specific pastoralism within the northern part of the peninsula? Before a final decision is attempted, it may well serve us to review a similar problem from the eastern Sahara, in a similar ecological zone, in a similar time period, and under similar circumstances. McHugh has suggested that based on his particular model, cattle nomadism was practiced in the Gilf-Uweinat area of the Sahara, a region which today receives less than 50 mm of rainfall. His reconstruction calls on an examination of four ethnographic examples from semi-arid African plains (McHugh 1974a:239). Based on these four societies, he concluded that four factors enabled cattle pastoralism to exist:

1. An annual minimum rainfall of 400 mm and 600 mm in dry season refuges.
2. Distinctive topography to preserve water sources.
3. Rejuvenation of wet season ranges.
4. Induced rainfall through special environmental circumstances.

If less than 400 mm of rainfall occurred, special circumstances were necessary to preserve water (dams, tanks, bores). In areas of 200-400 mm of rainfall, ovicaprid and camel herding were more common (McHugh 1974a:241).

Interestingly, McHugh's idea that domestic cattle were present in the Gilf-Uweinat area is based solely on rock art stylistic grounds (McHugh 1974a:237). Therefore, he continues, the area must have sustained an early Holocene rain pattern of 200–600 mm annually in a graded isohyet pattern (Gabriel postulates 300–400 mm rainfall annually in the central Sahara for a similar time period 1977:66). While McHugh states that he cannot determine if the remains of the site belonged to a winter or summer occupation, he suggests that in the dry season, the cattle herds would have concentrated in the wadis where the highest annual rainfall fell and that they fanned out in small scale settlements during the rainy season. The latter settlements would have been quite transitory, lasting

only as long as pasturage and surface water held out. At the end of the rains, the movement would have been back to the core areas of reliable water (McHugh 1974a:241-2).

The Mehri way of life diverges from the McHugh model in several important ways. First, if we analyze rainfall and topography using McHugh's data set, we would not suspect that the Mehri were cattle pastoralists. The rainfall data supplied by Janzen (1986:Figure 10) only averages 97 mm per year with the median at 70 mm. This pattern contrasts sharply to the figures supplied by McHugh. Similarly, a cursory examination of pastoralists who occasionally herd cattle within the coastal plain of the Horn of Africa, suggests an annual rainfall between 10–150 mm annually (Brandt and Carder 1987:204). In addition, the Mehri population and settlement pattern is opposite to that construed by McHugh. The permanent settlement is during the wet season and small scale and dispersed settlement occurs during the dry season. Finally, there is virtually no evidence of permanent structures in the Gilf-Kebir area (McHugh 1975:34), a fact noted also by larger surveys of the Sahara (Gabriel 1976:34; 1977:65; Connor 1982) and the Horn of Africa (Brandt and Carder 1987). Thus, African archaeological structural parallels cannot be compared either to the Mehri or the North Arabian pastoral complex (for an ethnoarchaeological study of the Tuareg in the al-Hoggar of Algeria, see Gallay 1988).

In summary, we would suggest that the North Arabian technocomplex represents the remains of cattle pastoralists, based on the ethnographic information derived from the Mehri of the southern coast. In terms of climatic improvement, we would note that winter precipitation for the area was certainly greater, but the cumulative effects of the summer monsoon have yet to be effectively analysed. The lifestyle of the people was almost certainly transhumant with the large winter aggregates contrasting to the small-scale summer homesteads. The structures in terms of size and layout may parallel the Mehri examples. They then would suggest small nuclear family dwellings interspersed with cattle (and ovicaprid?) shelters defined by size and function. The entire settlement would have specific kinship relationships as defined by the layouts described by Janzen. The specific way of life defined by the technocomplex comes to an end in stages between 2300–1900 B.C., but it now appears that the sites of the second millennium B.C. of central Arabia bear little resemblance to the northern technocomplex. In other words, the Mehri do not represent a southern continuum of a specific way of life which originated in the northern Arabian peninsula. Rather, as we have suggested, the specific comparisons between the Mehri and the technocomplex point only to similar lifestyles revolving around the domestication of cattle.

Survey of Deserted Bedouin Campsites in the Negev Highlands and its Implications for Archaeological Research

Gideon Avni
Israel Antiquities Authority

Years afterwards it is still possible to recognize an old campsite, Marh al 'Arab. The fireplace hollowed out in the man's compartment; the small piles of ash and clay; the three scorched stones by the fireplace in the women's compartment... all these awaken memories in the mind of the solitary traveller. (Musil 1928:78)

This picturesque description by the Czech explorer, Alois Musil, from his research on the Rwala bedouin tribes, illustrates the central theme with which this paper deals: the archaeological definition of nomadic activity remains, and the utilization of data received from surveys of recent nomadic campsites as a source for archaeological comparison and interpretation.

Traditional archaeological research in Palestine pays little attention to the material culture of nomads. The complex of relationships between nomads and sedentary settlements in peripheral desert regions is explained in most historical and archaeological discussions as a continual conflict (Juli 1978:29; Banning and Kohler-Rollefson 1986:152–153). Processes of urban decay in the peripheral areas of Palestine were seen as the result of violent intrusions of nomads who left no archaeological evidence and who, following their conquest, would either integrate into the existing population or disappear as though they had never been (for example Kenyon 1960:135–137 on the Middle Bronze period; Negev 1967, 1969, 1976:345; Sharon 1977:199–202; Parker 1987:41–47; Bowersock 1971:227-228; Caskel 1954; Vasiliev 1956 on the first to seventh centuries C.E.).

Modern anthropological research examining the mutual relationship between nomads and sedentary peoples emphasizes, rather, the interconnections between the two groups (e.g., Barth 1961:93–100, 1973; Swidler 1973; Hole 1978; Khazanov 1984:3). From these works it is evident that nomadic societies are dependent economically, socially and politically on nearby sedentary settlements. Lancaster (1981:44–45) notes that the modern Rwala Bedouin need stable urban centers in close proximity as part of their economic base. Banning (1986:44–45) emphasizes the mutual connections and co-existence prevailing between nomads and the sedentary population in Transjordan during the Roman-Byzantine period.

Various studies involving the identification and interpretation of activities of ancient nomads based on archaeological remains have been undertaken recently in the Middle East. These works, and especially the intensive surveys carried out in various places, can assist us to define the material connections between nomadic and sedentary cultures through different periods. One of the central problems which the studies tackle is the extent to which one can identify evidence of nomadic cultures from archaeological remains. Some scholars suggest that as nomads leave no significant material or architectural vestiges it is impossible to differentiate nomadic settlement using archaeological techniques (e.g. Finkelstein 1984:188–189; Finkelstein and Prevolotsky
